IMMIGRATION INTO THE UNITED STATES FROM THE UNITED KINGDOM AND GERMANY, 1820--1885.

CONSULAR REPORTS
ON
EMIGRATION FROM EUROPE.

No. 76.—APRIL, 1887.

NOTE.

The following reports are selected from House Executive Document No. 157, second session Forty-ninth Congress, and are intended to give a general view of the actual conditions which control the emigration from European countries to the United States:

DEPARTMENT OF STATE,
February 9, 1887.

To the President:

I have the honor to transmit a series of reports from consular officers of the United States on the extent and character of the emigration from their respective districts. As supplementary to this series, reports will be found from consular officers in Canada, Mexico, Central and South America, and Australia describing in general terms the nature of the immigration into those countries. Taken together these reports afford a complete representation of the movements of population from one country to another, the streams in which this movement flows, and the factors which determine the extent and direction of these streams. To summarize the results of this survey would be almost impossible, as local influences are dominating causes, and the conditions in no two countries, even in no two districts, are the same. The prevailing motive of emigration is the desire to secure a greater degree of welfare, to move from a place where the struggle for existence is continuous and intense, to a place where a higher degree of prosperity may be obtained for the same expenditure.

One feature of this subject, which received little attention in the consular reports, viz, the countries from which the highest proportions of skilled labor as compared with the total emigration are derived, has been outlined by tables prepared in this Department from the returns of the Treasury Department. The result tends to show that when the industrial welfare of the United States is considered, indiscriminate restriction of immigration would be quite as mischievous as indiscriminate permission is sometimes represented to be.

Respectfully submitted.

T. F. BAYARD.

DEPARTMENT OF STATE,
BUREAU OF STATISTICS,
February 9, 1887.

SIR: I have the honor to submit the replies of consular officers of the United States in Europe to questions respecting the extent and character of emigration from their consular districts. The fulness of these replies leave little to be desired, and covering a period of nearly thirteen years—a period of great commercial and industrial depression, of a partial recovery followed by a second series of years of stagnation—the reports give a fair idea of the conditions which control or influence emigration under all economic conditions. Each nation or people, and each district, may have its special incidents which should be taken into account; but the great tide of emigration ebbs and flows in a clearly defined movement consequent upon the economic situation in the original country, as compared with the prospects of success in the country to which emigration tends. It is the difference between economic well-being in Europe and that in the United States, being so much to the advantage of the latter, that has turned the stream of population hither, and not to younger communities where the conditions of success are now less favorable, though becoming more and more advantageous to the emigrant. As supplementary to the reports from European nations, there will be found reports from our consuls in Canada, in Mexico, and in Central and South America, giving the conditions of emigration, and the special features which are attracting emigration. Taken as a series, too great praise cannot be given to the industry and intelligence which the consular service has shown in replying to the questions submitted by the Department.

There is one phase of the question that may be dwelt upon, the more so because it has received little attention in the reports that follow—the migration of skilled labor. The mobility of labor, whether skilled or unskilled, is a comparatively recent economic phenomenon, and has done much to modify the conditions of production, still more of competition, whether local or national. The extended employment of machinery, which demands a lower or less intelligent grade of labor than was needed when the processes required skill and judgment of the worker, has still more tended to equalize, and at the same time to intensify the conditions of competition. By displacing labor, these forces tend to en-

TOTAL IMMIGRATION INTO THE UNITED STATES FROM EUROPE FOR THE FISCAL YEAR ENDING JUNE 30, 1886.

[Shaded portion represents male immigrants.

The line running through the diagram represents the proportion of male and female for all Europe.]

The movement of population from European countries, and in this connection it may be stated that Europe alone supplies any real basis for study and comparison, has assumed vast proportions, more than half a million of souls annually leaving their own countries to seek homes in another. In 1884, a year that was not marked by an exceptional migration, the twelve leading nations of Europe gave 567,588 emigrants, the United Kingdom and Germany supplying nearly 70 per cent. of the total. The distribution of this movement was as shown in the diagram.

Nearly two-thirds of this movement were directed towards the United States, and since 1874 nearly 5,000,000 of such immigrants have been received, constituting a total equal to about one-eleventh of the present population of the country. In detail the distribution of emigration from the more important countries of Europe was as given in the accompanying chart:

This vast movement of population cannot be of uniform quality, for the advantages of migration and the opportunities are quite as accessible to the highest forms of skilled labor or to men of property, as to the masses of unskilled labor and the idlers who congregate in the great cities. The immigrants received from one nation may be far more desirable than those from another. It was to determine, as far as possible, the character of the immigrants coming to the United States, not the least important of the many questions involved in an unrestricted immigration, that the Department instituted this inquiry. There has of late been shown no little restiveness among workingmen caused by the increasing difficulty of obtaining what they consider to be adequate wages, always tending downwards, it is claimed, by reason of the flood of "cheap labor" coming from Europe. It is no part of my intention to pass upon the justice of this complaint, or to show how the domestic laborer, himself usually of foreign origin, may be protected from foreign competition. A study of the returns of the Bureau of Statistics, Treasury Department, will show from what countries the highest forms of skilled labor are obtained, and to what extent each nation contributes to advance the industrial development of this country by making such contributions.

Total immigration classified by occupation.

The table on page 3 shows that in a period of depression the proportion of skilled labor tended to increase, and this would be the natural consequence, as that labor receives the highest wages, is able to save more, and therefore emigrates more readily. On the other hand, those without occupations are the soonest to feel the effects of a depression. Allowance, however, must be made for sex, as the larger part of emigrating females is classed with those having no occupation. As a further guide I give the proportion of each sex in the different classes of occupations:

MALES.

IMMIGRATION OF CERTAIN OCCUPATIONS IN 1886, SHOWING THE RELATIVE NUMBER FROM EACH COUNTRY.

The diagrams include merely the immigration during the fiscal year ending June 30, 1886. They show the remarkable predominance of the United Kingdom and Germany in supplying the United States with skilled labor, and also the fact that the Germans represent those industries that depend upon hand labor or the requirements of every-day life, while the English supply the mechanical element. While Germany sends blacksmiths, butchers, carpenters, coopers, saddlers, shoemakers, and tailors, the United Kingdom supplies miners, engineers, iron and steel workers, mechanics and artisans, weavers and spinners. This distinction is clearly marked, and is certainly important.

Since 1879 a new factor has been introduced that may affect the emigration of skilled labor from the Continent of Europe to the United States, and nowhere is the influence to be stronger than in Germany. I refer to the active interference of the state with a view (1) to render the demand for labor more active by giving it a wider range of employment, by raising its standard of living by means of a more careful regard for its comfort, of a provision for sickness, accident, or old age; or (2) by controlling or directing the stream of emigration that it may inure to the benefit of the mother country and not of other and foreign countries.

In Germany, in 1878, a system of inspection of mines, factories, &c., in the interest of the laborer was introduced, the duty of the inspectors, who are Government officials, being to see that shops, mills, factories, and mines be properly ventilated, that the machinery be placed so as not to needlessly endanger the safety of the employé, to guard against the employment of children in dangerous or overtaxing labor, and to protect generally the worker against oppression. This system of inspection is as yet crude and imperfect, the force of inspectors being out of proportion to the work to be performed. Nor was this all. The principal employers in each community are compelled to maintain a bank or fund in connection with their workingmen for the relief of the employed in case of sickness or disability, the employer contributing one-third of such fund and the employed the remaining two-thirds, each worker contributing in proportion to his or her wages. Finally, on the 1st of October, 1886, the accidents insurance act, providing for the organization of workingmen into societies for relief in case of accident, became of force. "It is a social-political act of great importance to manufacturers and workingmen," says Commercial Agent Smith, "and will doubtless be far-reaching in its effects."

The thrift of the German laborer is proverbial, and the efforts of Government and of individuals have been of late chiefly directed to fostering this feature of his character. Banks, public and private, labor legislation, such as factory inspection, insurance of workingmen, and the like, have been the main instruments of raising the workingman as far as is possible outside of direct gifts or charitable offerings out of a state of dependence upon his daily labor for his daily bread. This has reacted upon his condition, and has given him that slight encouragement to remain at home, the lack of which formerly directed his attention to new fields of labor—as in America. The margin between want and sufficiency has been widened by ever so little, but no one is in a better position to take advantage of it.

he could undoubtedly find. The recent report of the German factory inspectors gives a picture of the life of a factory operative that is far from favorable. The inspectors would have no interest in exaggerating the unfavorable aspects of a laborer's situation, and would be more apt to err on the other side. Yet the detailed statements printed in the appendix give ample evidence of the urgent necessity for emigration as well as of the inability of the workingman to migrate without state or private assistance.

Of the German population about 35.5 per cent. is engaged in manufacturing industries, counting also the families of the earning persons. The effects of the rise of manufactures in Germany have been exerted chiefly on only about one-third of the total population. There remain more than 19,000,000, or 42.5 per cent., of the total population engaged in agriculture not immediately subject to these influences. The import duties upon grain have not resulted in higher prices to the farmer, and his situation is little better than it was in 1879, though a succession of fair harvests have in a measure repaired the losses incurred in the succession of bad years that followed 1873. The German farmer still constitutes the larger part of the emigration from Germany, and supplies the largest contingent of that class in the immigrants into this country.

The position of Germany is peculiar, in that it has a rapidly increasing population, that is continually crowding upon the limited areas, as yet unoccupied or uncultivated, and upon the opportunities for profitable employment. There is no outlet, such as the vast plains of Russia offer, to the increasing population of that country for colonizing from within—if I may use the term—a process that has prevailed in the United States. Prussia was long the "colony" of the other parts of Germany, the tide of migration flowing from the rural districts into towns, from towns into cities, and from the cities to the capital, wherever the highest returns were offered to labor. The advantages to be gained by a change of this sort are much reduced, the movement itself tending to equalize conditions. Yet the German population must increase and does increase.

Emigration from Germany has a close connection with the rapid increase of population in that country.

The following table shows the proportion in which the different German states increased in population since the census in 1875 and the percentage of inhabitants per one square kilometer (equal $2\frac{1}{2}$ acres):

Table showing the area, population, and its increase since 1875 of the German Empire.

States.	Area (exclusive of parts of seas), square kilometers.	Population.			Percentage of inhabitants per one square kilometer.	Percentage of total population in all places with 2,000 and more inhabitants.	Percentage of total population in all places with less than 2,000 inhabitants.	Average percentage of yearly increase of population, 1875 to 1880.
		Total.	2,000 and more inhabitants (not cities).	Less than 2,000 inhabitants (cities).

The relative importance of this rate of increase may be seen when compared with the condition of France, where the population is increasing at so slow a pace as to awaken the most serious apprehensions on the part of her people. The London Economist said in August, 1886:

The movement of births and deaths in France has never attracted more attention than since the late war, but although politicians and statesmen have pointed out the national danger of stagnation in the population compared with the rapid increase in England and Germany, the warning has so far produced no effects. From that point of view, the returns for 1885 are by no means reassuring. The number of births in that year was 922,361, or the minimum since 1872, with the exception of the year 1880, when the number was 920,177 only. From 1878 to 1884, exclusive of the year 1880, the average had been from 935,000 to 937,000, which was besides a considerable diminution on the previous years. In 1872 the births reached 966,000, notwithstanding the losses in the adult male population from the war; 1873 gave 946,364; 1874, 954,652; 1875, 950,975, and 1876, which was an exceptional year, 996,682. Thus, compared with 1876 the births in 1885 show a falling off of over 74,000. The diminution at the same time coincides with a steady increase in the proportion of illegitimate births, which has risen from 7.15 per cent. in 1879 to 8.03 in 1885. This can only be explained by a reluctance among the male population to assume the burden of a family, and the desire to prevent the dissemination of fortunes by a compulsory division among legitimate children. The effects of the decrease in the births are in some measure palliated by the longer duration of life, which may be also a consequence of the decrease of pauperism from the prudential habits of the nation in the matter of large families. The number of deaths in 1885 was 836,897, and only five times since 1872 has a smaller number been registered, but the excess of births over deaths.

From 1872 to 1877 the

The pressure of population by increasing the struggle for existence is a powerful influence in encouraging emigration, but it does not, of necessity, follow that the largest emigration comes from the most populous district. The returns for the first nine months of 1885 may be cited as an indication of the relative importance of each district or province as regards emigration.

Nor must the question of wages be omitted. The *Leipziger Zeitung* in November summarizes the report of the factory inspectors on the

lation of Germany would be doubled; while France, for instance, with an increase of her population at the rate of 0.36 per cent. per year, would not reach double the number of her present population for two hundred years.

The yearly increase of population is given for 1884 to be—

[From report by Consul-General Raine.]

Countries.	Increase.	Period of doubling.
	Per cent.	Years.
Germany.....	1.50	47
France.....	1.40	51
England.....	1.35	52

question of wages, showing that the movement of population coincided in a general way with the rates of wages:

What a motley picture! What differences even in this, the lowest class of wages! How manifold the conditions of life and labor, not only in the relations of the different states to each other, but even within the narrow borders of a minor state. Not only do East and Northwest Germany differ from each other up to 150 per cent. (compare, for instance, Oppeln and Stade), but the average wages of even the little Thuringian capital exceed those of the neighboring mountain village by 100 per cent., and one town often exceeds the next by so much. Froessen and Goerkwitz, for instance, two villages in the principality of Reuss (Younger Line) differ by precisely 160 per cent. in the day wages for female laborers. To construct a "normal rate of wages," which should satisfy "them of Froessen" as well as "them of Goerkwitz," is probably beyond the skill of any social democratic conjurer.

But enough of these gentlemen. It is impossible within the limits of a newspaper article to exhaust all the deductions and teachings which arise out of the table. But one observation may be permitted.

It is easy to pursue the line of increase which average German wages follow from province to province. It begins with the lowest wages in the extreme east (East and West Prussia, Silesia, Posen), touches the district of medium wages in Middle and a part of South Germany, and then reaches the highest rates of wages in the empire by two branches, one which travels to the southwest (Reichsland, Wiesbaden, &c.), and the other to the northwest (the Hanse towns, with their adjoining territory as far as Hanover and Schleswig). It is therefore precisely the same line as the German immigration follows, "the migration to the west."

Even the law which governs local divergencies within the limits of each province, provincial district, and minor state is clearly defined by the figures of the compilation, which we are unfortunately unable to give in detail. Here it is not the "migration to the west," but the "migration to the town," where the higher rates of wages, especially in the large towns, are the attraction.

One would imagine that the continuous flow "towards the west" and "towards the town" would gradually equalize the differences in wages. But there is no trace in our table of any such equalizing influence of the freedom of movement.

The action of the state may also be exerted in directing the stream of emigration into certain channels where the supposed advantages will be greater to the directing state. The colonizing policy of Germany had for its object the founding of colonies, where room may be found for the surplus population, where the inhabitants will still be subject to the mother country and where new markets will be found for German manufactures. On this point Consul-General Raine wrote in 1885:

The necessity for extending the dominion of Germany, in view of such steady excess of births over deaths, forced itself upon the statesmen of the Empire, and even if we place the number of emigrants on the average at 80,000, according to German statistics, or more (about 100,000 according to ours) per annum; such emigration does not balance by far the increase of births, 540,000 per annum; hardly 16 per cent. of the increase are absorbed by emigration. It is but necessary to add that under such circumstances the colonial policy, so unexpectedly inaugurated, met with universal approval throughout Germany. A Berlin paper says:

"We Germans have long been colonizers on a large scale; but, unlike the English, French, Dutch, and Portuguese, we have always colonized lands belonging to other Governments, and not our own."

Considering the annual growth of the nation, the question was then asked:

"Could not the Government acquire for them territories where they would continue to be under German jurisdiction and enjoy the fatherland's protection?"

EMIGRATION FROM EUROPE.

The foundation of colonies and the encouragement offered to emigrants are too recent measures to be as yet judged. The flow of emigration shows little change, as the following table will prove:

German emigration in ten years, 1875-1884.

Years.	Total.	Emigrated to—							Number of emigrants per 10,000 inhabitants of the German Empire.
		United States.	British North America.	Brazil.	Central America, South and Mexico, South America.	Australia.	Africa.	Asia.	
1875	30,773	27,834	38	1,387	450	1,026	1	37	73
1876	28,368	22,767	11	3,432	847	1,226	54	31	66
1877	21,964	18,240	11	1,069	557	1,306	750	31	50
1878	24,217	20,373	89	1,048	545	1,718	394	50	55
1879	33,327	30,808	44	1,630	517	274	23	31	75
1880	106,190	103,115	222	2,119	539	132	27	36	235
1881	210,547	206,189	286	2,102	876	745	214	35	464
1882	193,869	189,373	383	1,286	1,205	1,247	335	40	426
1883	166,119	159,894	591	1,583	1,125	2,104	772	50	362
1884	143,586	139,339	728	1,253	1,335	666	230	35	311

Without attempting to enter into a discussion as to what the real effects of Germany's protective policy has been, there is no doubt that the opportunities for the employment of labor has been greatly increased since 1879. For example, in 1879 170,509 men were employed in mining black coal; in 1883 the number had increased to 207,577, though 503 works were in operation in 1879 as compared with 489 in 1883. So again 721 brown coal mines in 1879 engaged 24,156 miners; in 1883, 665 mines employed 26,824 men; in 1879, 19 copper mines contained 9,118 miners, and in 1883, 36 mines contained 14,326 miners. In 1879, 2,487 mineral works in operation gave employment to 275,711 miners, and in 1883, 2,567 works contained 334,137 miners, the increase in the number of works being about 3 per cent. and in the men employed more than 21 per cent. So again in the furnaces and foundries the number of works increased from 227 to 270, or about 19 per cent., and the hands employed from 32,242 to 42,724, or about 33 per cent. The returns for other great industries, such as the textile and sugar industries, are not at hand, and while the metal industries, and more especially the iron and steel industries,* have been greatly, almost abnormally stimulated,

* FROM CONSUL WAMER'S REPORT.—The subjoined table shows the production, import, export, and consumption of pig-iron, in the German customs territory, from the year 1865 to the year 1885, inclusive:

Years.	Production.	Imports.	Exports.	Consumption.	Years.	Production.	Imports.	Exports.	Consumption.
	Tons.	Tons.	Tons.	Tons.		Tons.	Tons.	Tons.	Tons.
1865	2,001,457	583,858	306,825	2,078,490					

there can be little doubt that other industries would show a like movement, though on a more moderate scale.

It does not follow, however, that the absolute welfare of the laborer has been improved through an artificial creation of a greater demand for his skill. The continued fall of prices consequent upon an enormously increased production is a general feature of the present period, and Germany offers no exception to the rule. The prices of iron per ton since 1879 have been as follows:

Markets.	1879.	1880.	1881.	1882.	1883.	1884.	1885.
Berlin:	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.*</i>

Best German foundry	62.6	87.1	73.3	75.0	72.9	65.7	58.4

*Mark equivalent to 23.8 cents.

This movement of prices has resulted in enforced economy, and it may be questioned whether the full effects of the increased demand for labor have not been felt, and not only must there ensue a more moderate extension of industry, but also a reduction of the number of working-men, either by the shutting down of unprofitable works or by the substitution of machine for hand labor. This means that the increase in the number of laborers is no longer commensurate with the extension of industry; that the period of expansion is ending and a period of contraction will in all probability follow. In support of this position may be cited the *Berliner Tageblatt* of October 22, 1886:

The report on the condition of industry and the demand for labor, stated in general that, as in the previous year, so also in the year of the report, many opportunities of work were presented at reduced wages. While there are some districts where the statistics are more unfavorable, there are also some which show an improvement, especially for certain branches of industry. Further on it is stated that in all the districts, with slight exceptions, the number of establishments, as well as that of the laborers, has increased, yet the increase of the laborers has been relatively smaller than that of trade. The reason lies in the growing endeavors of industry to displace hand-work by machinery. A result of this development is a constantly increasing crippling of the smaller business in comparison with the larger, especially, *e. g.*, of the hand-looms in the different branches of textile industry. Hand-work has also had to suffer much, because, as for instance, in articles for shoemakers, the wholesale manufactory is taking the place of the more moderate production by hand.

That the unfavorable condition of agriculture reacts directly on industry, particularly machine industry, is especially mentioned in some of the districts.

Indeed, it cannot be denied that the general condition of industry has been correctly sketched in the foregoing sentences, but how do the many opportunities for work, which are said to have been presented, agree with this? If the increase of laborers is not equal to that of business, if in the development of industry the tendency prevails to displace hand-work by machinery, and if the smaller establishments are thereby kept in the back-ground in comparison with the larger ones, it is perfectly clear that the field in which human hands are demanded must become constantly narrower, and in that endless progression there must be a surplus of laborers. The above-mentioned many opportunities for work, which are said to have been presented, represent a small part of the total production.

in the foregoing year. In many establishments the number of laborers has been diminished, smaller jobs or holidays have been introduced, and here and there the wages have been lowered, so that the entire pay of the laboring classes seems to have been lessened." They say of Aix la Chapelle: "The number of laborers is somewhat lessened, but according to the report the diminution of industrial pursuits has been relatively larger than that of the number of laborers. The result of the diminution of industrial pursuits has been that in many establishments the number of working hours per day has been considerably reduced."

In the district of Leipzig the number of laborers has increased in spite of the unfavorable condition of industry. The report says: "In almost all branches of business there is complaint, to an increased extent, of overproduction, damaging competition, the low prices of the manufactures, and the consequent unsatisfactory profits of industrial enterprises. In connection with the reduction of the prices of raw materials, this caused the shortening of the time of work, the lowering of wages, partly also the discharge of laborers, and the suspension of entire establishments."

It would take too much space to give all that the reports on the unfavorable condition of industry contain. We will only further note that in the report from Thuringia there is complaint of the ruin of the textile industry. In other provinces in which the sugar industry is the most important, especially in the districts of Merseburg-Erfurt, Anhalt, and Brunswick, the continued unfavorable condition of that industry is reported, which naturally reacts on the laborers. Machine manufacturing is also thereby unfavorably influenced. As to the condition of mining, the report contains only what is unfavorable.

In the communications facts are brought in from districts to try to show a rise in industrial development. It cannot be denied that in some branches a brisk business has been carried on, but it is only in those which do not form the foundation of the business life of Germany, but the less important branches of industry.

One would not go astray in asserting that the rise which is supposed to show itself in the increase of business and establishments in many districts is only apparent. It is correctly stated in the report on the district of Dresden: "In the year of the report the business establishments of the districts have again partly increased, partly become enlarged, but there is no mistake but that these increases must be regarded as the last endeavors to try to reach the profits of former years. There was an almost universal standstill, particularly at the end of the year, if not retrogression of the larger business establishments to be observed, which manifested itself mostly in diminishing the working hours."

The following observations of the factory inspectors of the district of Zwickau are characteristic of our industrial relations: "Since, with every to any extent favorable condition of business, attempts are made to enlarge existing establishments and to equip them with machines capable of a great amount of work, or to establish new factories by making use of the concessions made by machine manufactories, the production of goods must be increased above the usual demand."

So that while the economic policy of the Empire has probably tended to discourage the emigration of skilled labor by creating employment for it at home, such an artificial structure cannot remain intact. The sugar industry is an example of extreme inflation, and the iron industry is not far behind it. In default of foreign markets the home markets must be glutted, mills and works run on short time or shut down, and labor without employment. The strenuous endeavors of German manufacturers to cultivate a foreign trade, and in this they have had all possible favors from the Government, have been attended with a noteworthy success, and especially in Central and South America. But such new markets are gained at great cost and are not without their limits. It follows, therefore, that the task of finding an outlet for an over-stimulated production must be more and more difficult, and the time will come when the skilled labor of Germany, crowded out at home, must seek employment elsewhere, which means in the United States.

debt may be taken as an evidence), even though the share of each is small, satisfies the wishes of the Frenchman and lead him to endure without complaint what would be unendurable to an English or an American laborer. The succession of bad or deficient harvests which succeeded 1873, touching as it did the material interests of nearly the whole population, and the visitations of such a pest as the phylloxera, were not incentives to emigration, as the following figures show:

Emigration from France, 1870-1883.

Year.	Number of emigrants.	Year.	Number of emigrants.
1870.....	4,845	1877.....	3,666
1871.....	7,109	1878.....	2,316
1872.....	9,581	1879.....	3,634
1873.....	7,161	1880.....	4,612
1874.....	7,080	1881.....	4,456
1875.....	4,464	1882.....	4,858
1876.....	2,867	1883.....	4,011

The climax of the period of speculation in the United States, offering as it appeared to many exceptional opportunities for improving the material welfare of the immigrant, but probably the more immediate and active force—the war between Germany and France—give the highest result in 1872. Even this 9,581, represents barely $\frac{1}{4}$ of 1 per cent. of the total population of the country in that year (36,102,921), a proportion so small as to be almost of no account so far as numbers go.

Taking 1883 as the year for examination, it is found that out of a total emigration of 3,940 from the 87 departments into which France is divided, 9 departments supplied 1,854 or about 47 per cent., and these 9 departments were the only divisions which gave 100 or more emigrants. The following are the details:

Alpes (Hautes).....	217
Doubs.....	119
Meurth et Moselle.....	111
Pyrénées (Basses).....	364
Rhin (Haut).....	129
Rhône.....	103
Saône (Haute).....	194
Savoie.....	229
Seine.....	388

Small as these figures are they represent in some cases a large percentage of the total, and even more than the total, increase of population in the department to which they apply. This is the case of Alpes (Hautes). The births in 1883 numbered 3,473 and the deaths 3,347; the excess being only 126. Yet the emigration was 217 for that year. So also in the Saône department, the births were 5,933 and the deaths 5,852, leaving an excess of only 81, which was more than absorbed by an emigration of 194. In Rhône the deaths exceeded the births by 272, to which must be added an emigration of 103, making a total loss of 375 in one year. The low returns of emigration, therefore, are in reality high when compared with the total population of increase. M. J. 5555 55

The report of Consul Mason (Marseilles) shows how little emigration is stimulated by a grievous and exceptional depression, such as was produced by trade and industrial stagnation and a visitation of cholera, for the number of French emigrants leaving Marseilles was less in 1885 than in any year since 1879, with the exception of 1884. The complication of ills raised the exodus from 472 in 1884 to 538 in 1885, an increase of only 14 per cent.

The destination of French colonies is in Algiers or the Argentine Republic in preference to the United States, greater inducements being offered; the Germans, on the other hand, come to the United States.

France and Germany were taken for the basis of these notes because of the active interference of the governments in industrial and commercial affairs.

It is difficult to determine how far these influences have as yet influenced the character of the immigration. In 1873 the number of skilled immigrants in the Treasury returns was 48,792; in 1879, 21,362; and in 1886, 36,522. The percentage supplied by each nation of Europe showed that in the interval marked changes occurred. The proportion of the United Kingdom, France, Germany, and Norway decreased, the change being especially marked in Germany and France, the two nations that have adopted a policy of protection. On the other hand the proportions of Austria-Hungary, Belgium, Denmark, Italy, Russia, Sweden, and Switzerland show a notable increase, while the percentage of the Netherlands remained almost stationary. In detail these proportions are:

Countries.	1873.	1879.	1886.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
United Kingdom	40.91	35.07	37.58
England	25.08	21.71	22.19
Ireland	8.06	5.66	5.98
Scotland	7.33	7.09	8.72
Austria*	1.37	2.93	5.43
Belgium	.32	.31	.72
Denmark	1.10	1.28	2.04
France	3.30	4.10	1.79
Germany	30.77	21.37	25.45
Italy	1.10	2.04	5.48
Netherlands	.53	.25	.51
Norway	3.38	3.41	2.66

Sweden	3.48	4.92	4.86
Switzerland	.68	2.77	2.02

* Includes Hungary and Bohemia.

† Includes Poland and Finland.

In spite of the efforts made to direct emigration into certain channels, the United States has attracted and will continue to attract the bulk of migrants. The reappearance of Government as a colonizing agent is noteworthy, as a revival of a portion of the mercantile system that prevailed at the beginning of the last century. The time was when the immigrants were an object of protection, not only as regards the adminis-

tage of the mother country. Even Italy, that sends her people to South America in preference to the United States, shows symptoms of also desiring colonies in Africa. In Great Britain the functions of government are still confined to the care and protection of the emigrants, though a recent move—the institution of an office of inquiry, as described in the inclosure to Consul-General Waller's report—may lead to a further attempt to direct the outflow of population to British colonies. The policy of assisting emigration to relieve pauperized or overpopulated districts is openly taught by English statesmen, and has much to commend it, though little more than a temporary expedient. Organized emigration, whether undertaken by individual or public effort, has rarely proved successful.

Not the least satisfactory part of these reports is the absence of instances of a deportation of criminals and incapables. The necessity for a more strict supervision on immigrants is, however, insisted upon by the executive officers who receive immigrants at the principal ports of this country. The insane and criminal may be excluded, but there is a class that has quite as little claim to be received—the chronic pauper. It is true that the pauper, like the blind, the cripple, and the lunatic, is subject to special bonds as liable to become a burden and a future charge to the State, but there is abundant evidence that this restriction is not sufficient, and that our public institutions are largely recruited from the ranks of the immigrants. The State boards of immigration were created to protect alien passengers, and to prevent, as far as is possible, the introduction of paupers and criminals. The execution of this purpose has been very defective through a complication of authority. In the State of New York an act of 1876 provided, in substance, that the captain, consignee, or owner of every vessel arriving at the port of New York from a foreign country, having on board immigrant passengers, should give a bond to the people of the State in the penal sum of \$300 for each of such passengers, to indemnify the State against any charge or expense on account of the passenger named in the bond within five years from arrival. This provision was commuted into a payment of so much for each immigrant (ranging from \$2.50 to \$1.50) to the commissioners of immigration, such payments to constitute a fund for reimbursing communities for charges incurred in supporting or relieving an immigrant within the term of five years mentioned. This system was adopted in 1847, and remained in force until March, 1876, when the law was declared unconstitutional. The decision withdrew the whole subject from State supervision, and placed it under the control of Congress. As no action, however, was taken by Congress, the State, in 1881, undertook to collect a head or inspection tax on every alien passenger, a measure that was also declared unconstitutional. In August, 1882, the existing national law was passed. The experience of Massachusetts has been nearly the same.

The number of immigrants returned by the New York commissioners to the ports whence they came was in 1883 1,350, and for the following reasons: 53 were insane, 6 were blind, 4 deaf and dumb, 16 idiots, 25 cripples, 60 enciente, 649 incapacitated through illness, 75 by reason of old age, and 462 were, through destitution or inability to obtain employment, unable to maintain themselves without becoming a charge. In 1884

[From a report by Commercial Agent Smith, published in Consular Reports No. 74, page 371.]

WHAT DOES IT COST A WORKINGMAN WITH A FAMILY TO LIVE?

This is a question which has often been asked the consular corps by the Department and variously answered. The inspector for the Leipsic district last year obtained from sixteen heads of workingmen's families, who were designated by their employers as orderly persons, statements of what it annually costs them to live, and only in four instances out of the sixteen cases was the income slightly greater than the expenditures, which had to be made up by the wife or other members of the family, or some necessity done without in the twelve other cases.

Five of the detailed statements made are published in the factory inspector's report, and I herewith give them (with the mark reduced to dollars at 23.8 cents to the mark):*

1.—Expenses for one year of a family of eight persons.

Items.	Amount.	Items.	Amount.
Bread	\$54 45	Local tax and state income tax	\$1 82
Butter	26 52	Wood	1 90
Potatoes	11 13	Coal	12 37
Coffee and chicory	9 28	Bed-straw	1 90
Meat	26 18	Bed-clothing and towels	5 71
Milk and curds	6 20	School books and writing materials	2 14
Beer, tobacco, and brandy	2 79	Chimney sweeper	17
Oil and soap	7 14	Brushes, combs, grease for leather, and blackening	95
Salt	1 07	Mending and renewal of household articles	2 38
Flour	2 38	Shoes	3 57
Wheat bread	10 71	Clothing	3 57
Rice and other vegetables	3 57		
House rent	15 70		
School tax	4 45		
Dues to invalid fund	3 71		
Insurance against fire	97	Total	222 81

The income was \$3.68 a week, making an annual income of \$191.82, leaving about \$30 to be made up by the family in some way.

2.—Expenses for a year of a carpenter and his wife.

Items.	Amount.	Items.	Amount.
Corporation tax	\$3 83	Coffee	\$8 63
State tax	1 98	Barley	1 23
House rent	35 70	Milk	6 18
Tax on personal property	59	Fuel	18 56
Dues to invalid fund	5 32	Soap	6 18
Pocket money	30 94	Coal-oil	2 47
Clothing and shoes	9 90	Oil for burning	2 47
Bread	24 75	Thread, yarn, and needles	1 23
Butter	37 12	Matches	23
Salt	1 23		
Flesh	24 75		
Vegetables	12 37	Total	235 76

In this case the income was \$4.83 a week, or \$251.23 a year, without missing a couple of day's work.

*In consequence of not carrying the decimals out far enough in the reductions, the total sums will not be in exact agreement with the columns when added up, but are correct.

3.—*Expenses for 14 days of a family consisting of a man and his wife and two children, one one and a half years old and the other four, the man earning \$8.56 every two weeks.*

Items.	Amount.	Items.	Amount.
Six loaves of bread (every two weeks) at 18 cents a loaf	\$1 11½	6 cigars.....	\$0 05½
Every Sunday morning 8½ cents, worth of rolls, &c.....	33½	125 grams of smoking tobacco.....	04½
Every Sunday at dinner ½ kilogram of meat, at 16½ cents, and meat four times during the week, each time ¼ of a kil- ogram, at 7½ cents	96	Curd for potatoes	08½
One-half kilogram of suet in the soup....	16½	1, 250 grams of flour	12
One-half kilogram of fat.....	19	Dues to factory invalid fund.....	11½
One-half kilogram of sausage	19	Private fund.....	06
Potatoes.....	52	Total 14 days	7 51
8 pieces of butter, at 16 cents a piece....	1 33½	For year.....	195 23
For the smallest child, 3 cans Swissmilk.	50	Annually for funeral money	71
Clear sugar, 1 kilogram	19	Straw for beds.....	95
Loaf sugar, ¼ kilogram.....	06½	Rent.....	11 42
Vegetables, 750 grams rice, 750 grams peeled grain, and 750 grams millet....	25½	Taxes, including income tax.....	2 76
One-half kilogram of coffee.....	42½	Fuel	14 28
1 package wheat coffee.....	00½	Shoes.....	8 33
6 herrings, at 2½ cents each.....	14½	Clothing.....	21 42
Vinegar and sweet oil	04½	Bed-clothing	3 57
Soap for washing clothes, ½ kilogram....	10½	4 glasses of beer on Sundays.....	09½
Grease for washing clothes, ½ kilogram .	08½	Hats, &c	1 19
Soda and starch, 750 grams	10½	House utensils.....	47
Hair-oil.....	0 02½	Keeping furniture in good condition...	47
Spices	0 02½	Thread, needles, ribbon, and buttons..	47
Coal-oil.....	14½	Yarn for making stockings	71
Salt, 1 kilogram.....	04½	Total annual expenditure.....	261 87
Blacking and grease for shoes.....	02½	Income	222 76
		Excess.....	39 11

This man was a wool-spinner. His beer account, it will be noticed, is all wrong, and ought really to be \$4.76 for the year.

4.—*Weekly expenses of a locksmith's family, consisting of himself and wife and two girls, one 11 and the other 13 years old.*

Items.	Amount.	Items.	Amount.
Rent.....	\$0 71	Vegetables	\$0 09½
Fuel.....	28½	Butter (3 pieces).....	50
Taxes.....	13	Cheese (4 pieces).....	06½

Bed-clothes and towels	07	Beer	16½
Yarn, thread, and ribbon	04½	Total	5 41
Soap and soda	09½	For year	281 30
Coal-oil	08½	The average income for six years past was.....	285 60
Blacking and matches	02½		
Bread.....	47		
Meat (¾ of a pound daily)	71		
Potatoes (2 pounds a day)	19		
Pulse	12		

EMIGRATION FROM EUROPEAN COUNTRIES TO ALL PARTS OF THE WORLD.

[Shaded portions represent emigration to the United States.]

5.—*Expenses of a dyeing master for two weeks, having for a family himself and wife, two sons, one learning to be a joiner and the other still going to school, and a daughter.*

Items.	Amount.	Items.	Amount.
7 loaves of bread, 4 kilograms to the loaf, at 18 cents.....	\$1 26½	Annual funeral dues.....	\$0 98½
Small rolls.....	28½	Taxes.....	2 57
Flour.....	23½	Fuel.....	14 28
8 pieces of butter, at 16½ cents.....	1 33	Bed-straw.....	71
7 liters of milk.....	13½	Shoes for all.....	11 90
5 eggs.....	07	Clothing and hats.....	23 80
Cheese and curds.....	13½	Keeping furniture and utensils in order.....	71
Fat, suet, and lard.....	35½	School expenses.....	10 71
Sausage.....	14½	Postage.....	14
Potatoes, ¾ of a centner.....	50		
2 kilograms of meat.....	61	Total for year.....	65 81
Dried and green vegetables.....	47½		
Salt and spices.....	12	Grand total for year.....	254 03
Coffee and sugar.....	57		
Herrings, vinegar, and oil.....	14½	His wages amount to \$8.568 for every two weeks, and annually (deducting 12 holidays).....	214 14
Coal-oil and rape-oil for light.....	19	Rent from a factory girl living in the house.....	10 23
6 liters of beer.....	17		
Thread, ribbon, buttons, and needles.....	09½	Entire income for year.....	234 37
Blacking and grease for shoes.....	02½		
Factory invalid fund.....	11½		
Private invalid fund.....	06		
Total for two weeks.....	7 23½		
Total for year.....	188 11		

No rent is included in the above statement, because his daughter, grown up, pays for it with money earned by sewing, but he boards her free of charge.

[Circular.]

DEPARTMENT OF STATE,
Washington, April 27, 1886.

To consular officers of the United States in Europe :

GENTLEMEN: You are instructed to report, at your earliest convenience, upon the extent and character of the emigration from the consular district in which you reside to the United States. The importance of this question at the present juncture will doubtless impress upon you the necessity of a full and fair report, covering not merely the statistics of emigration, but the general habits, morals, and social condition of the classes of the population which contribute most to the emigration. The following specific questions are merely to serve as a guide in preparing the reports. You are not, however, expected to confine your replies to them, but to contribute whatever may serve to determine the general condition of those seeking new homes in the United States.

(1) Statistics—a series of years, or since 1873, would be desirable.

(2) Classes which supply the greatest number of emigrants, agricultural, industrial, &c.

(3) Causes of the emigration, such as compulsory military service, onerous taxation, strikes, surplus population, &c.

(4) Social condition; tenants or landowners; well-to-do or paupers; general manner of living as regards housing, eating, and clothing; marriage and divorce facts: children, natural and legitimate. This branch of the inquiry will apply to the whole population of the district, and not to the emigrants merely, though it will be well to examine particularly as to that part of the community.

(5) Do you know of any deportation of chronic paupers or insane persons, with or without Government aid? Or of any "assisted" emigration; and, if yes, how do these "assisted" emigrants compare with those who leave their country voluntarily?

(6) Attitude of Government towards emigration; and, if unfavorable, what obstacles are thrown in its way?

(7) *Special* " " " "

AUSTRIA-HUNGARY.

BUDAPESTH.

REPORT OF CONSUL STERNE.

I regret that I have not succeeded in obtaining the exact figures, but from all that I could gather it will be safe to assume that about 70,000 in all will cover the extent of such emigration within the past twelve years; further, that previous to the year 1874 this movement was not of a size worthy of mention, unless I would refer to the emigration which took place in consequence of the revolutionary troubles in Hungary of the years 1848-1850 (the time of Kossuth), the results of which compelled a number of people to leave their country.

These "emigrés" all belonged to the best classes of society, and I believe that those who remained in the United States eventually proved a valuable acquisition to our country; many of them, however, returned to their native home after a total amnesty had been granted.

CLASSIFICATION.

The emigration from Hungary deserves to be classified as follows: Firstly, into what can be called general emigration by individuals from all classes of the people and from the greater part of the state; and secondly, into a systematic movement *en masse* by one class of people only, and only from one district of the state. My attention has been principally confined to the latter class, and I wish it to be understood that the details given in this report refer more in particular to the same.

The great mass of these emigrants belong to the agricultural class, but also include some who have been employed in the timber-industry and in mines; in quality they all represent what is called "raw labor" and of the "rawest sort" at that, since in their occupations they have thus far been very little accustomed to the use and the handling of machinery or improved tools.

CAUSES OF EMIGRATION.

"Hard times" is the main cause of the emigration from here as it is from other countries, with the difference, however, that here these "times" either did not exist as early as in other countries, or, if they did exist, they were not felt by these people, on account of their peculiar stage of culture.

Overpopulation is certainly not one of the causes of this emigration. To the contrary, Hungary, in its manifold resources, has the capacity of holding a much larger population than it has, especially when compared with other continental states of less resources.

That, under such conditions, there should be any emigration at all is
 That, under such conditions, there should be any emigration at all is
 That, under such conditions, there should be any emigration at all is

ery, thereby actually creating a surplus of this branch of labor, while the development of other branches of industry has not been rapid enough to give employment to those who have thus been deprived of work. Much of this surplus is drawn to the cities, where there are efforts now being made to develop the industries, but a part of it is compelled to leave the country to obtain the means of living, and thus the movement to America has been brought about.

The last census of Hungary demonstrates this clearly, for while the cities show quite a gain in most cases, there are some of the rural districts which, instead of increasing, have hardly held their own in the past decade.

High taxation has of course much to do with causing emigration, but in this case more indirectly through its influence on the standard of wages and in causing an increase in the cost of living. The improved and increased means of transportation have also had their influence on the latter in advancing the prices of the main staples of life where they are produced, and which is thus most severely felt by the rural population, while the same means have actually made possible and introduced some items of expense and even extravagance which before the event of railways had never been dreamed of by these people in their simplicity of mind, habits, and tastes.

Compulsory military service, though nowhere cheerfully submitted to, is not a cause of this special class of emigration, for those who go away have either absolved their duty already or they intend to do it when they return; this "return" being explained further on.

The idea of a "strike" is thus far as little known to these people as that word itself may be, but dull and slow as they are individually they possess, "as a mass," so much the instincts of sheep that they can only too readily be taught and induced to follow a leader, whom they will follow "blindly," thus increasing the dangers should their otherwise non-dangerous inclinations be turned into a wrong direction by evil-minded persons; this all the easier since their education is so very defective.

POLITICAL CAUSES.

Though not directly belonging to the special object of the inquiry, I will here say that since the advent of extreme nationalism (Chauvinism) in the politics of Europe there is a sort of migration in practice, especially in the southeastern portion of the continent, by which Hungary, as one, yearly loses some of its population, though she also makes some gains by the same cause. It is brought about by this that the several nations of this part of Europe, since they have succeeded in establishing a more fixed status as nations, are making efforts to repatriate the descendants of those who have been lost to them during the voluntary and involuntary *Völker-Wanderungen* of the past centuries, and a success in this is made quite possible from the peculiar fact that though these different peoples have been thrown together for ages, many of their descendants have retained the tribal characteristics of their ancestors in general appearance, habits, and character, as well as their likings or prejudices of race, not to forget also of language.

Of all these states I believe there is

fact that these races occupy by large majorities different portions of the state and have thus been or are thus able to retain their own characteristics. Much of the old rivalry is yet existing amongst them all; and, since some of them at least believe themselves oppressed by the dominant race, it is comparatively an easy matter to induce some of them to return to the homes of their ancestors, where in turn they may enjoy the satisfaction of belonging to the great majority, though for solid benefits they are seldom benefited by the change. The interested parties, in this case the neighboring states, see to it of course, even if not officially, that the necessary sentiment is developed and that the necessary means are furnished to smooth the way homeward.

I find after all that the previous remarks were in place, for they go to show that there are people living in Hungary who though in close contact with others for many years and whose interests seemingly and reasonably should be the common ones, have retained their individuality to such a degree as to prevent their becoming citizens of their state in its fullest sense; just such a class are those who furnish the principal contingent of the emigration to America.

They are the Slovacks and belong to the Slavonic race and they inhabit principally the northern counties of the state, which are proverbial for their poorness of soil and general resources, in consequence of which the Slovacks are also the poorest people in the state.

Notwithstanding this and all I have said about race feeling, these people feel much attached to their mountain homes and will only leave them when necessity compels them to do so, but then always with the fixed determination to return to their homes as soon as their aim has been reached. This aim, when going to America, is to make what is a fortune in their eyes, and in this they usually succeed in about three years. When they move about nearer to their homes they usually remain away during the season of harvest or during the building season in cities, and then their object is mainly to provide the means for their long winter; and while they are thus away they conscientiously send home supplies to their families.

CHARACTER OF EMIGRANTS.

It is usually the men only who thus leave their homes, and, though at all times practicing the closest economy, they will when away even strain a point so that their object may be attained the sooner, and at such time they can be said to fairly compete with the Chinese as far as the most penurious practices of economy; and were it not for their love of strong drink they could fairly be called the most frugal people living as far as the demands of the body go, and I may say here that the above inclination has a great deal to do with their impoverished condition.

More directly in answer to your queries I will say that I believe none of these emigrants to be paupers, nor is there any danger under reasonable circumstances that they may become such in America; for, unlike the gipsies of Hungary, the Slovacks are not born beggars; to the contrary, they are all willing to work, and all the harder if by doing

land unit with them), but they have either lost this entirely or are so much in debt that, at home, nothing short of a miracle can save them from total ruin. To either possess such wealth as this or to recover it where lost is generally the utmost limit of all their ambition.

HABITS OF LIVING.

Their manner of living is the very plainest; their homes are often nothing but scanty huts, of one room, wherein the whole family lives and sleeps promiscuously. The furniture and outfit is very primitive, mostly home-made and has to last for generations. The same can be said as to their clothing, "biled shirts" being quite an unusual luxury with the men. The body clothes of the latter are made of coarse linen, their summer clothing of the same material, only coarser, and in winter their clothing consists of suits made from a coarse and thick woolen felting, in the natural color of the wool; an everlasting cap of sheepskin and a pair of sandals about complete an outfit which has been in mode with them for generations and which may be heir-looms, since the style hardly ever changes.

A very important part of their outfit is the very roomy and long mantle without sleeves, made up from half a dozen sheepskins which are tanned, the wool being left on; these "overalls" are ever with them, and, as the season may demand, are worn either with the wool on the in or out side, and when the men are away from home these mantles form their complete bed. What these patriarchal cloaks may lack in style is generally made up for by some gaudy embroidery or even painting on the leather side of it, just as also the bodices of sheepskin are "trimmed," which the women wear in winter. The many and wonderful "discoveries" in dress of the female world at large has not yet reached these women, and their extravagance usually spends itself in the acquisition of a number of high-colored handkerchiefs and ribbons for head and shoulders, though some of them who have traveled beyond their home limits have gone as far as to adopt the red or yellow top-boots of the Hungarian peasant women.

I do not wish to be unjust to these people, but from all I can learn their demand for water is but very limited for the use of the outer body as well as the inner.

FOOD.

At home their diet consists principally of milk, potatoes, corn and rye bread, coffee and the meats being reserved luxuries of the wealthier for Sunday or holidays.

While laboring in cities there is added to the above, if such can be done cheaply or gratis, the remnants or offal from the restaurant, or if times are specially "flush" with them fresh meat is bought from the butcher in the shape of the lungs, livers, or other unpopular but cheap portions of the beef. Their preferred drink is a sort of brandy made from potatoes or prunes, the latter called "*slivovitz*," and since the presence of the Slovacks in America this brandy has become an article of export from here to the United States.

In all, it will be seen that the tastes of these
refined people

With the same stated object, they are, when employed *en masse* in the cities, not very choice as to the quantity, quality, or even set of their bedfellows. Thus as many of them as can, men and women alike, will pack themselves into a room or cellar over night, and without the least regard to cleanliness or comfort.

The sanitary consequences of such habits form a standing threat and danger to the health of this city for instance, and the authorities often are compelled to make raids at night to dislodge these disease-breeding pest holes.

MARRIAGE AND DIVORCE.

Marriage is quite common with these people; but, since divorces either cannot be obtained on account of obstacles of religion or on account of the expenses connected therewith, many of the people of necessity fall into a state of concubinage, or wild marriage (*Wilde Ehen*), and this has become so general also amongst the poor classes of the whole state that it forms a publicly acknowledged evil. This also is one of the main causes of the large proportion of illegitimate children in the state, though the statistics show that just amongst these Slovacks the showing is not as unfavorable as in other portions of the state, or especially in the cities.

(Exact statistics covering this and other points of the inquiry will appear in a body at the end of this dispatch.)

Another cause of the number of illegitimate children here in general is the fact that the young men practically cannot marry until their military duty has been absolved. In justice to these, however, it must be said that in most cases they assume the responsibilities which were the fruits of their peculiar form of courtship as soon as they return from the army by marrying the mothers of their too previous children, and it is quite fortunate for these "otherwise" poor mothers that in their case a common rule is reversed, in that it permits "public opinion to adapt itself to circumstances," thus making it not only possible but even "the" proper thing that such marriages do take place.

Certain is it that an overamount of sensuality does not exist amongst these people and is not the cause of their seeming immorality; at any rate a diet as described is usually not apt to develop the former.

Abject poverty and dependent position have far more to do with the things as they are; thus the females of the poorer classes often lack the necessary powers of resistance, and lack of proper education has done the rest to rob them of the needed sense of discrimination; and though serfdom* has ceased to exist for very many years, I think there are those yet to be found in this country who are not yet fully aware of 'all' the boons which emancipation has brought them.

MORTALITY AMONG CHILDREN.

As also properly belonging to a description of the Slovacks, I shall say that the mortality amongst their children is large beyond proportion, and this is also an evil which exists again in the whole state. *of this, though births occur in rational numbers, the* *increase.*

ASSISTED EMIGRATION.

I have no knowledge of any deportation of chronic paupers or insane persons with or without Government aid.

"Assisted" emigration there has been a few years ago, as already referred to in my dispatch No. 2, of May 19, 1880. While I have not been able to lay my hands on to any positive facts I will say that it is generally known that many of these emigrants have been secured by labor contractors at the beginning of the movement, while now it is kept up by the aid which desiring emigrants receive from friends who are already in America. Besides this, there is every reason to believe that transatlantic transportation companies do their share towards making these people "travel."

ATTITUDE OF THE GOVERNMENT.

The described shortness of population, especially of the laboring classes, causes the authorities of the state and the owners of estates to look with the greatest disfavor upon the movement.

The authorities use every possible method to repress the movement, but the most effective remedy has been lost to them when the compulsory passport system was abolished. Though passports are not issued to people who may be in debt or who have attained a certain age and not yet absolved their military duty, these always find a way to leave the country when they want to go; and the people who are not in debt and who can obtain passports are not those who want to go.

Another repressive measure resorted to is to keep close watch upon the movements of suspected emigration agents, and I am sure that these are shortly dealt with when caught at work.

Much stress also seems to be laid upon giving publicity of any piece of unfavorable information concerning the United States, and all the newspapers of the country seem to be alike willing and patriotic in aiding the Government in this object. but all labor is certainly wasted in this instance as long as the Slovacks in America continue to send their little checks of money to their friends in this country, and though these are usually but very small sums, they represent vast fortunes to these modest people.

I believe there would not be so much objection after all to this emigration were it only money that the people send or bring back to their homes; but something is imported thereby which but few continental governments seem to digest with a good grace, that is, "American ideas"; and in this case I believe that this Government cannot be said to be altogether wrong if they treat this article with suspicion, for crude as these Slovacks leave their country, crude they also return, for their exclusiveness and love for herding result in their imbibing while in America not ideas of real "liberty," but ideas of "license." Thus the emigration is not only an economic loss to the state, but also carries with it items of social and political danger, and no wonder that the Government would by all means like to stop it.

GENERAL CONCLUSIONS.

I am of the opinion that with the present condition of the labor market in the United States there is no room there at present for this class of people. I even believe that under more favorable conditions in the United States these Slovacks are not a desirable acquisition for us to make, since they appear to have so many items in common with the Chinese.

Like these they are extremely frugal, the love of whisky of the former being balanced by the opium habit of the latter.

Their ambition lacks together in quality and quantity. Thus they will work similarly cheap as the Chinese, and will interfere with a civilized laborer's earning a "white" laborer's wages.

Like the Chinese, again, they are very exclusive people, and though American institutions may go a great ways towards removing this defect, it will surely require generations to make them enlightened citizens, where emigrants of other nations only needed a few years.

Of their habits I shall not speak, since the changed situation would undoubtedly act wonders in this respect in a short time.

Another main objection to them is that, like the Chinese, they do not intend to remain in our country, not even as long as the latter, though like some of these, also, an occasional Slovak may "stick." But to show how sincere and strong their intention is to return home when they emigrate, I will state what I have from very good authority, namely, that some of the better-to-do families give their daughters in marriage to men upon the special condition, that after a reasonably lengthy honeymoon the husband must go to America to make his fortune, when he may come back again to his wife, and while thus away they all conscientiously supply their families with the necessary means of living, thus again, like the Chinese, becoming no permanent benefit to the United States, their earnings never staying in the country.

To say a last word about these Slovacks, they are, after all, a people more to be pitied than anything else, but charity should begin at home.

In addition, I shall now say a few words about the emigration by individuals, first referred to, but a very few remarks will describe this, since it is very much of the same sort as has left the Continent for years and which should be well enough known in the United States. While the Slovak emigration sometimes depopulates whole villages, the latter consists simply in the leaving of an individual now and then and from any part of the state, and these are then most generally the Hungarians proper, or, if a particular sect may also be named, sometimes the Jews.*

Neither of them like to leave their country, and they only go in the hope of improving their financial situation.

They are mostly farmers or merchants who have not succeeded at home, now and then a discontented mechanic or tradesman also goes, though I believe that very few of them all would leave, even under pressure, were they to know that also in America people have to work, and work even harder than is done here, if they would accomplish anything.

I believe that many of these would not need to be hurt in their patriot-

the same perseverance and judgment as might be desirable; but it is not my business to lecture these people, and the character of them has been once already described to the Department.

As a class I can say for them that they are intelligent, quick, and capable, and under any reasonable conditions in the United States they will succeed and become valuable citizens of our country.

Following are the statistics relating to the subject, taken from a census at the close of 1884:

Total population of the state, exclusive of Croatia, Slavonia, and Fiume, 14,341, 276. The number of marriages during the year, 144,416; of divorces, 1,047. The total number of marriages in the three countries from which the Slovacks principally emigrate, and having a total population of 696,549, are, marriages, 6,424; divorces in the same countries, 25.

The number of illegitimate children of the whole state is 55,243, out of a total of births of 660,068; in the above countries, illegitimate births, 2,068, out of a total of 26,565.

The total number of deaths in the whole state is 449,621, of which 233,378 fall upon children under five years of age.

In the above countries, total of deaths, 18,144; of which children under 5 years, 8,558.

These figures will speak for themselves.

HENRY STERNE,
Consul.

FRANCE.

REPORT OF CONSUL MASON, OF MARSEILLES.

The statistics of emigration from this port during the past eight years present the following exhibit:

Years.	Emigrants.		Nationality.		Total.	To the United States.	
	By sea from Marseilles.	By rail via Havre, Bordeaux, and Antwerp.	French.	Foreign born.		French.	Foreign born.
1878	5,745	4,589	177	10,254	10,431	18	243
1879	12,182	7,139	536	19,785	20,321	43	5,183
1880	10,072	4,784	708	14,148	14,856	83	3,593
1881	13,305	5,045	859	17,491	18,350	60	3,615
1882	15,863	7,112	799	22,176	22,975	114	3,875
1883	13,967	9,069	803	22,233	23,036	73	5,654
1884	6,482	2,494	472	8,504	8,976	71	630
1885	7,863	3,785	538	11,113	11,651	46	1,141
Total.....	85,479	45,117	4,892	125,704	130,596	508	23,934

It thus appears that during the past eight years the native French emigration from here to the United States has averaged only sixty-three persons per annum, a number too insignificant of any elaborate

complete their lading and then clear for ports of South America, and it thus occurs that thousands of Italian emigrants are registered as coming from Marseilles, whose only knowledge of this city is the little they have seen of it from a steamer moored during two or three days in the harbor. The vessels of the two regular steamship lines from here to New York touch, *en route*, at Naples or Palermo, and it is there that they mainly receive the thousands of emigrants whom they land every year at Castle Garden. For these reasons only a trifling minority of the emigration which comes nominally from Marseilles can be considered as within the province of this report.

When from a great port like Marseilles, having direct connections with nearly all parts of the world, the aggregate emigration of native French citizens to all countries averages only six hundred a year, it may almost be said that the people of Southeastern France do not emigrate at all. The reasons for this are sufficiently obvious. Persistent and extensive emigration uniformly has for its causes either extraordinary industrial depression, a superfluous population, an oppressive home government, religious persecution, or a restless, nomadic character which impels people to alter their habitat for the mere sake of change.

None of these conditions, except perhaps the first, prevail in Southern France. French people are, perhaps more than any other in Europe, home-loving and patriotic. In general they know very little of foreign countries. They are taught to believe that no country is, on the whole, comparable with their own. Of those who emigrate a majority leave their families at home, and go abroad with the hope of making a fortune in a few years, with which to return and spend the remainder of their days in their native land. Their Government is not oppressive, and it guarantees freedom of religious faith and worship. The rate of taxation is high and military service rigid and burdensome, but the Frenchman recognizes the fact that the taxes which he pays and the martial service which he renders are alike necessary for the support and defense of his Government, and there are few things which a French citizen is not willing to do for the preservation and glory of France.

As a people the French are almost entirely destitute of the nomadic instinct. They lack the facility of the Germans and other European nationalities for acquiring foreign languages and adapting themselves to new and strange conditions of existence. They are not naturally colonists. Life abroad, even under the best conditions, is regarded an exile, to be endured rather than sought for and enjoyed. Moreover, there is no part of this district, except perhaps the city of Marseilles, since the blight of epidemic has fallen upon its commerce and industries, where the population may be considered redundant. In several departments, notably the Basses-Alps and Vaucluse, the population is steadily declining, and there are villages and communes where this decline already causes apprehensions for the future of agriculture. In many districts the land is so rough and difficult that the use of labor-saving farming machinery is practically impossible, so that productiveness can only be secured by a large and constant outlay of manual

publishing discouraging reports from colonies and immigrants in foreign countries and in urging their readers to be content at home. For the reason, already stated, that most French emigrants expect to return home after having accumulated a fortune abroad, a large proportion go to South America, which, being a comparatively new and sparsely peopled country, is supposed to offer special opportunities for rapid accumulation of wealth. The few who go to the United States are mainly those who have relatives among the people of the Gulf States, or artisans who seek in the great cities of the Atlantic coast a more profitable field for their skilled labor. The one exception to this which has come under my observation has been a movement on part of a small number of young men from the neighborhood of Montpellier, who have sent one of their number to examine the soil and climate of Texas, with a view of establishing there the culture of wine.

It follows from all this that the very limited emigration from this part of France to the United States includes little or nothing of those elements which are coming to be recognized in our country as dangerous and undesirable. The Marseillaise, notwithstanding their record in French history, are neither agitators nor anarchists, and until the recent strike among the coal-miners at Decazeville (just outside the limits of this district) there has been, during the past five years, at least, no serious revolt of the laboring classes in this part of France. There are in this city communists who hold secret meetings and rejoice over the disorders created by their clans in other districts and countries, but they are under careful police surveillance and make no serious demonstration, politically or otherwise. During the communal troubles of 1871, communists, to the number of perhaps 300, rose and seized the prefecture, from which they were subsequently driven by the Government troops, but even this small band of revolutionists were mostly Italians or fugitives from Northern and Central France, and their movement received no active support from the local population. Business went on as usual, and when the abortive revolution was suppressed popular opinion approved the execution of its leader and the transportation of his confederates.

During the recent elections, one candidate of communistic antecedents was included in the list of deputies, but he fell 10,000 votes behind his colleagues, and his recent attendance at Decazeville and his outspoken sympathy with the disorders there have been generally regarded with ridicule.

FRENCH INDUSTRIES.

The industrial situation, which here, as elsewhere in France, is in a state of depression, unless relieved, must compel some increase in emigration. Besides the general causes which during the past five years have affected more or less all French industries, the effects of two successive epidemics of cholera, followed during the past six months by the most prolonged and severe visitation of small-pox in the history of Marseilles, have been disastrous to all classes of commerce and manufacture. Among the coal-miners of this district 11 per cent. of the usual working force was discharged or idle during 1885.

Out of forty manufactories of olive and seed oils, twelve were closed during the year. In the iron works

force of 3,340 men employed in 1883 was reduced last year to 2,120, a loss of 36 per cent.; out of seventy flouring mills in this department twenty were closed last year, and the remainder for most part were operated only by day, so that fully one-third of their former employés were discharged.

Nothing could more clearly illustrate the peaceable, submissive character of the Provençal working classes and the satisfactory relations between them and their employers than the fact that this steady and prolonged reduction of working force in these several industries provoked no revolt or disturbance. In many cases the suffering and destitution have been pitiful, but the discharged workmen recognize the depression of business as the real cause of their distress, and patiently hope for better times. Mendicancy has increased, and several meetings have been held by the port draymen and laborers to protest against the increased duty on cereals, which has enhanced the price of bread and largely reduced the import and handling of grain at Marseilles, but, as we have already seen, the growing distress of last year produced no appreciable effect upon emigration. Only 538 native French citizens emigrated from here during 1885, and of these 46 only were destined to the United States.

The most noticeable reaction has been against the foreign laborers—notably Italians—whose presence overcrowds the diminished labor market. There are in this city more than 54,000 Italians, who hold toward the native laboring classes a relation somewhat similar to that of the Chinese in the Western American States.

The Italian laborer is quite as industrious and even more economical than the Frenchman. His wants are so few and simple that he can exist upon a small percentage of his earnings, and in a competition of wages he underbids the native laborer. In several parts of this district there have been heard recently sharp protests, attended in some instances by violence, against the Piedmontese, who swarm across the frontier and seek employment in mines and tanneries and upon public works; but these manifestations have been promptly suppressed and denounced as uncivilized and dangerous to French working-people in other countries.

It is not probable that industrial depression will, in future, compel any important increase of emigration from this country. Besides the ingrained national aversion to wandering, there remains the fact that France produces no surplus population.

A comparative study of the birth-rate of this and other European countries shows France to be the lowest, except Ireland, in the scale of human production. While England has a yearly birth-rate of 35 per 1,000 inhabitants, Bavaria 40, Belgium 51, Scotland 35, Spain 38, Italy 37, Germany 38, and Sweden 52, France and Ireland have only 27, and even this low standard of fecundity is steadily declining. In Marseilles, for example, the birth-rate in 1866 gave 1 birth for every 30 inhabitants, but this has gradually fallen off, until the average from 1881 to 1886 has been less than one birth to 35 of the registered population. This loss becomes still more striking when placed in contrast

Coming down to the past three years, a study of the vital statistics of Marseilles presents the following striking results:

Years.	Births.			Deaths.			Death rate per 1,000 inhabitants.	Excess of deaths over births.	Marriages.	Divorces.
	Legitimate.	Natural.	Total.	Total including suicides and murders.	Suicides.	Murders.				
1883.....	9,189	1,569	10,758	11,190	135	19	<i>Per ct.</i> 31.07	432	2,793	-----
1884.....	9,133	1,645	10,778	12,500	104	18	34.71	1,722	2,704	4
1885.....	9,348	1,564	10,912	12,152	120	33	33.75	1,240	2,926	135

No census has been taken since 1881 until Saturday last (May 30), the results of which will not be announced for some time, but it is believed by those best informed that the population of Marseilles, which was 233,817 in 1856, 260,910 in 1861, 300,131 in 1866, 312,864 in 1872, 318,868 in 1876, and 360,099 in 1881, has not sensibly increased since that time.

Theorists attribute the decline in the birth-rate of France, and also its increasing death-rate, to the employment of married women in factories and mines, instead of, as formerly, at home and in the fields. The result of substituting this prolonged and excessive labor, instead of the natural domestic duties of women, has been to greatly increase the proportion of still-births and raise the death-rate of children to startling proportions. According to a recent writer (Mr. Pierre Roux), 50 per cent. of all children born in France die before the age of five years. Taking at hazard two local and recent examples, we find that of 38 deaths during the past week at Toulon 24 were of children, while at Marseilles, during the same period, the proportion was 122 children in a total death list of 278.

Morally the condition of Marseilles compares more favorably, its percentage of illegitimate births being only 16 against 23 in Paris, 25 in Brussels, 14 in Berlin, 24 in St. Petersburg, and 41 in Moscow.

The remote causes of a physical decline which, according to published statistics, now causes the rejection for disability of one-third of the 300,000 conscripts annually drawn for military service in France, are of course far beyond the scope of this report, but the facts herein stated will sufficiently explain the limited and decreasing native emigration from this country, and the efforts of the national and local governments to conserve their physical resources by encouraging their people to remain at home.

FRANK H. MASON,
Consul.

UNITED STATES CONSULATE,
Marseilles, June 7, 1886.

GERMANY.

BERLIN.

REPORT OF CONSUL-GENERAL RAINE, OF BERLIN.

STATISTICS.

It is a noticeable fact that German official statistics furnish no classification of the occupations of emigrants. Nor can a comparison be made with our own emigration statistics, as the latter are published for the fiscal year, while German statistics are based upon figures for the calendar year. The discrepancy in the numbers of emigrants to the United States between the statistics of the United States and Germany is explained by the fact that the statistical bureau of the German Empire has control only over figures gathered in German ports since 1872 in Antwerp, and also using French sources in Havre, but has no control over the number of German emigrants embarking at Dutch and English ports, though it may be conceded that a considerable number of Germans emigrating by way of the latter ports go to the United States.

From the above it appears that our returns, generally, state the number of German immigrants higher than German returns, of which I first inclose a table showing the number of German emigrants via German ports and the Belgian port of Antwerp, for the fifteen years from 1871 to 1885, amounting to 1,412,914.

To this number of emigrants must be added the number of German emigrants embarking at Havre. But in this case the country of destination cannot be given. The total number of emigrants would now be as follows:

Years.	Via Havre.	Via German ports, Antwerp and Havre.	Years.	Via Havre.	Via German ports, Antwerp and Havre.
1871	287	76,199	1879	2,485	35,812
1872	2,593	128,243	1880	10,757	116,947
1873	6,776	110,414	1881	10,251	220,798
1874	2,511	47,623	1882	9,590	203,459
1875	1,489	32,262	1883	7,455	173,574
1876	1,258	29,626	1884	5,393	148,979
1877	939	22,903	1885	2,790	106,432
1878	1,399	25,616			

Hence the grand total of all German emigrants within the said fifteen years (1871 to 1885) amounted to 1,478,887. A comparison of the German emigration with the over-sea emigration of other countries is shown by the following table:

DISTRIBUTION OF EMIGRATION FROM
GERMANY IN 1884.

Of every 100,000 inhabitants, there emigrated in the years 1873, 1880, 1885, in which years the absolute figures of emigrants from the whole Empire were nearly equal:

1873	103,638
1880	106,190
1885	103,642

The different parts of the German Empire lost the following numbers of persons emigrated "over sea" for every 100,000 inhabitants:

Where from.	1873.	1880.	1885.	Where from.	1873.	1880.	1885.
East and West Prussia..	492	857	720	Wurtemberg	254	444	258
Brandenburg (including Berlin)	125	134	169	Baden	297	311	220
Pomerania	959	691	762	Hesse	235	326	259
Posen	702	601	586	Mecklenburg (both)	1,085	241	393
Silesia	57	70	71	Oldenburg	363	299	402
Saxony (province)	72	63	87	Brunswick	93	103	76
Schleswig-Holstein	596	569	561	Thuringian states	143	118	118
Hanover	338	350	421	Anhalt	64	55	45
Westphalia	79	153	120	Waldeck	166	242	354
Hesse-Nassau	253	268	231	Lippe (both)	113	133	242
Hohenzollern	156	231	156	Lubeck	163	149	208
Bavaria (right side of the Rhine)	184	183	166	Bremen	408	560	589
Palatinate	281	263	307	Hamburg	331	339	368
Saxony (kingdom)	96	139	92	Alsace-Lorraine	30	17	48
				Total	251	236	224

Emigration, by sex and age, in 1885.

Age.	Male.	Female.	Total.
Under 1 year	2,243	2,322	4,565
1 and under 6 years	4,945	4,765	9,710
6 and under 10 years	4,772	4,563	9,335
10 and under 14 years	2,263	2,028	4,291
14 and under 21 years	10,733	10,322	21,055
21 and under 30 years	16,068	11,710	27,778
30 and under 40 years	7,504	5,364	12,868
40 and under 50 years	3,700	3,191	6,891
50 and under 60 years	2,203	2,213	4,416
60 and under 70 years	1,101	1,112	2,213
70 years and over	213	175	388
No age given	82	50	132
Total	55,827	47,815	103,642

OCCUPATION.

As to the occupation of emigrants, no statistics are kept in Germany.

C. Herzog, late Imperial assistant secretary (for Alsace-Lorraine), in speaking upon this subject, referred chiefly to American estimates.

Remarkably low is, according to his statement, the number of emigrants who have a professional occupation, about three or four per one thousand emigrants; but he infers that the number must be larger, as many persons of this kind go to the United States as mere visitors, and change afterwards from visitors into permanent residents. Such persons, not arriving in emigrant vessels, are simply recorded as passengers. Musicians, authors, architects, apothecaries, and professors of graphic arts seem to be quite numerous.

Within the group of

From Exhibit A it appears that the bulk of Germans go to the United States; only 3 to 6 per cent. are scattered in other directions. Of some note is also the emigration to Brazil.

CAUSES OF EMIGRATION.

The causes for emigration represent peculiar features. As Roscher, the renowned political economist, says:

No incorrupt man will solve the tie which binds him to his parents, his father's house, his remembrances of childhood.

Apart from the few who have particular reasons of their own to see foreign countries, it can be safely asserted that the true cause of emigration is dissatisfaction with the conditions under which people live at home, and the desire to improve their personal and material comfort. Roscher has condensed them, as follows: Surplus population, surplus capital, surplus of educated men not available; finally, a certain political or religious discontent, hence disproportional relations to society (family, state, church, and property).

Regardless of the cause of surplus capital, or rather concentration of capital in the hands of a limited number of men, the facts stand forth that political and religious differences and dissensions in several epochs of history have resulted in extensive emigrations, particularly in times when either strong Governments were wanting or when Governments had been usurped by privileged classes.

It may suffice to allude to the Greek colonies of ancient times; to the colonization of Iceland by the aristocracy expelled from Norway, and, especially, to the origin of our own country.

Concerning modern emigration, it may be granted that, irrespective of those persons who, in conflict with social and other laws, preferred to leave their homes, a large number of persons went to our shores in order to find the "promised land" of liberty and equality, the land "where milk and honey flows."

The incomparably rapid increase of the United States in population, wealth, and political power, which, since half a century, has raised them to the rank of the first nation of the globe, exercised, of course, a great attractive power, with their enormous extent of untilled fertile soil, a quick and clever utilization of modern traffic facilities and the expediency of their political institutions, warranting to every one the necessary security for his person and property and fair play to develop his individual faculties.

Religious dissension is also one of the causes of emigration, as it was at the time of the Pilgrims, who first settled in our now so prosperous New England States, and two hundred years ago, when the Huguenots sought new homes in England, Ireland, and Prussia (then an electorate, Brandenburg), where, especially in the latter country, they became the founders of silk and other now thriving industries.

To what extent the recent Prussian church (May) laws (now about to be abolished) have led Catholics to expatriate themselves, is beyond my combining all these motives, the object emigrants

gave a table showing the yearly increase of population for 1884 in several European countries, as follows:

Countries.	Increase.	Period of doubling.
	<i>Per cent.</i>	<i>Years.</i>
Germany	1.50	47
Great Britain	1.40	51
Netherlands	1.35	52
Denmark	1.28	54
Austria	1.15	60½
Belgium	1.13	61
France	0.36	200

And pointing to the necessity for Germany to extend her dominion, I continued to report that—

Even if we place the number of emigrants on the average at 80,000, according to German statistics, or more (about 100,000, according to ours), per annum, hardly 16 per cent. of the increase are absorbed by emigration.

As will appear from a table here appended, the excess of births over deaths for 1884 in Germany amounted to 550,953 in number, leaving for this year 407,367 as surplus population, when 143,586 emigrants are deducted from the total number of the excess of births.

The number of marriages concluded, births and deaths of illegitimate children will appear from the inclosed tables marked Exhibits B and C. These tables compare the figures of the decade of 1875 to 1884, both inclusive.

Concerning the question as to the density of population, Dr. Elreberg, of Erlangen, gave for the year 1880 the following percentage of men per 1 square kilometer:

Germany	83.7
France	70
Italy	95
England	110
Netherlands	128
Belgium	186

If guided by these figures, it can easily be seen that although Germany has not only a large population, but also a large yearly increase of population, yet it must be conceded that there are other countries with a still larger population, but without an emigration, that would reach even approximately the lowest number of German emigrants.

Untenable seems, therefore, the assertion that Germany suffers under an onerous surplus of population, since it is notorious that the provinces with smaller density, Pomerania, Prussia, Posen, &c., show the largest percentage of emigrants, and that national wealth is growing at the same ratio as the number of population increases.

In those provinces exist very extensive landed manorial estates, where there is no chance for small farmers to purchase a homestead, or for the settlement of agricultural laborers in large numbers, as there is no full work for all of them throughout the whole year. In many instances those landed proprietors have resorted to machines to dispense with a sometimes doubtful class of laborers who came from other German districts to find employment, for the different districts harvest times

Thousands of working families pass through Berlin every spring to go to the sugar-manufacturing districts in the province of Saxony. In the fall they repass on the way home. Many of them use then their savings to found an undisturbed home in the United States.

INCOMES ARE DISPROPORTIONATE.

Though, as above stated, Germany's wealth, as a whole, increases with its population, yet the distribution of property is not normal and incomes are disproportionate. I give an example:

In 1885 Berlin's population amounted to about 1,300,000 persons; of this number about 200,000 were free from class-tax (the lowest tax collected), as their respective income did not reach the minimum of 420 marks, the limit for the payment of class-tax as prescribed by law.

One hundred and forty-eight thousand one hundred and twenty-eight had an income of 420 marks and upwards; 121,502 had 661 and upwards; 27,777 had 901 and upwards; 21,632 had 1,051 and upwards; 11,970 had 1,201 and upwards; 14,739 had 1,351 and upwards; 5,552 had 1,500 and upwards; 7,770 had 1,650 and upwards; 5,721 had 1,800 and upwards; 6,667 had 2,100 and upwards; 2,838 had 2,400 and upwards; 4,221 had 3,000 and upwards.

Taxes in Prussia collected on incomes from 220 marks to 2,999, both inclusive, are called *Klassensteuer* (class tax), while taxes levied on incomes of from 3,000 marks and upwards are called state income tax.

Still more instructive is a comparison of Berlin persons paying this latter tax. Of 1,250,000 inhabitants only 30,000 pay state income tax—5,100 had an income of 3,000 marks and upwards; 4,000 had 3,600 and upwards; 3,000 had 4,200 and upwards; 2,700 had 4,800 and upwards; 1,000 had 7,200 and upwards; 1,000 had 8,400 and upwards; 1 had 9,600; 1,100 had 10,000 and upwards; 820 had 12,000 and upwards; 101 had 18,000 and upwards; 81 had 54,000 and upwards; 81 had 60,000 and upwards; 56 had 72,000 and upwards; 52 had 84,000 and upwards; 43 had 96,000 and upwards; 23 had 100,000 and upwards; 27, 19, and 23 had more than 200,000; 8 had 240,000; 10 had 300,000; 5 had 360,000; 1 had 420,000; 5 had 480,000; 3 had 540,000; 4 had more than 540,000.

It is stated that from 500 marks, in the year 1869, the average income per year and person in Berlin went up to 627 marks in the year 1874; from and after this year such income went steadily downwards, reaching in 1883 the amount of 499 marks. Since then it went up again a little, to 534 to 555 marks. If overcrowded districts, which are mostly those where nearly exclusively manufacturing is carried on, contribute the largest percentages to the emigration, Berlin would be such a place; but, on the contrary, it attracts every year thousands and thousands of persons born in farming districts, who seek and find employment as servants, day laborers, &c.

The very same farming districts show also the largest number of emigrants, viz:

Districts.

Inhabitants
per square
kilometer.

Emigrants
per 1,000.

From this statement it is shown that the largest industrial districts, Saxony (Kingdom) and Rhineland, have the smallest number of emigrants, and *vice versa*.

OCCUPATION OF EMIGRANTS.

Herzog states that during the American fiscal year ending June 30, 1883, about 194,786 Germans immigrated into the United States; 857 of them were artists, authors, architects, chemists, &c. (professional occupations); 25,190 had skilled occupations; 51,282 were farmers, day laborers, servants, and dealers of goods, &c. (16,961 farmers, 25,586 day laborers, 3,357 servants, &c.); 117,161 German immigrants had no occupation whatever, being mostly women and children.

They are, therefore, mostly skilled artisans who emigrate, and farmers, day laborers, most of the latter being agricultural laborers, who will seek to get an independent existence after having done day's work for some time.

The percentage of emigrants out of men employed here in factories and mills seems to be of no account, as their inferior or one-sided training is their stumbling-block. They could find employment in America only as helpers at machines similar to those at which they worked at home. They would not materially change their condition in America.

PEASANT FARMERS.

But that formerly large portions of German population, consisting of mechanics, artisans who work at home and possess not only their own houses, but also small tracts of land which they till (in German also called *Ackerbürger*), being half farmers, half traders, they were and continue to be fittest for emigration. The probability of getting along better, or to improve their condition in America, is for them by far greater, as they are familiar with two branches of occupation. If farming does not pay or give employment, they resort to their trade.

To a much greater extent, however, than those house manufacturers, farming classes share in the number of emigrants. They have, through friends already settled in America, information sufficient to compare the condition of agriculture both here and in America.

As already reported in my annual report (see page 204 of Consular Reports, No. 61, February, 1886), last year prices of wheat and rye, the chief breadstuffs, notwithstanding the repeated increase of German tariff rates, were lower than ten years ago.

The present year, 1886, does not show any rise of prices at Berlin (the increase of duties took place in the years 1879 and 1885).

Breadstuffs.	1875.	1880.	1886.
	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>
Wheat	188.175	212.226	153.75
Rye	140.170	210.213	135.35

A farmer who thinks of the future will have the conviction that, under the circumstances existing, he will

ROMAN INHERITANCE LAW.

In Germany the Roman inheritance law is in force, which allows, or rather prescribes, settlement of estates by partition, either *in natura* or in money. In the former case the dismemberment of even a large real estate makes a systematic rotation in farming impossible, while in the latter event the keeper of the estate may be involved in such an amount of debts that he gets ripe for bankruptcy. German states have no such law as the American homestead law to protect him from ruin.

The Palatinate in Bavaria, for instance, where the greatest dismemberment of real estates is said to have taken place in Germany, contributes, therefore, large portions to the number of emigrants. The brothers and sisters of the keeper of the estate, instead of allowing themselves to be lowered into the position of mere servants, prefer to go with the money they receive as their shares to America, where to go they are often invited by former fellow-countrymen, who send them sometimes tickets or money for passage.

One of the leaders of the German Colonial Association was some time ago informed by a member of the North German Lloyd, Bremen, that for many a year about 60 per cent. of all emigrants forwarded on board their steamers had gone to the United States at the inducement, and mostly with the assistance, of such members of their families as had already firmly settled in the New World.

This and many other causes and reasons tend to prove why the main stream of emigration continues to go to the United States. Other reasons are to be found in the relative shortness, safety, and cheapness of the passage, as well as in the facility by railroads to enter the interior of the country; in the possibility to acquire there real estate at a cheaper rate than in Germany; in the salubrity of climate, which is similar to that of Central and Northern Germany, and which admits of farming similar to the German; in the affinity of language and manners of the predominant Anglo-Saxon population with the German; and, above all, in the prospect to get an independent husbandry and homestead to live upon his own ground.

PAUPERS, INSANE, ETC.

It is conceded by parties familiar with the subject that persons having no such support emigrate only in a very limited number. It is even stated as a "deplorable fact" that the very classes of population Germany could most easily dispense with, such as idlers, financial and moral bankrupts, insane, light-minded, and paupers, participate only to a minimal percentage in the emigration. And the latest measures taken by our Government against landing of such persons may have considerably reduced even that percentage. It could, however, hardly be prevented that scapegraces, provided with all the means required by our laws, are shoved over to our shores by relatives and parties being ashamed or afraid of them.

Even during the short time that I have been in office I have had frequent letters and personal appeals

TESTIMONIALS OF FITNESS AND CONDUCT, ETC.

But to recur to immigrants not desirable, it may be stated that, as a rule, by far the largest portion of persons above described, even if they were available, do not possess the passage money. Just the less skilled and poorest classes of the proletariat remain at home and perpetuate in their children pauperism and misery.

Cases, however, where communes, at their expense, might shift over to America such class of individuals, have, up to date, not come to my knowledge, though I have but little doubt that, by some means or another, persons of their kind have been shipped to the United States.

The bare resolution to emigrate on one's own strength, to defy the further uncertainty, and to be willing in new foreign relations to fight for a better existence than he enjoyed heretofore at his old place of domicile, presupposes a not ordinary degree of courage, self-confidence, energy, and vigor. Nay, it can be stated as a general rule that only middle classes can afford to emigrate, upper classes only exceptionally emigrating. It is even deplored in Germany that this diminution of the middle classes serves to enlarge unduly the gap between rich and poor, in the enlargement of which many other potencies are in full activity. It is further deplored that the very best industrial and productive classes, in comparatively large percentages, leave the ranks of German producers to enter the ranks of foreign competitors, taking with them millions of marks. Single statisticians estimate the loss Germany has thus far suffered (since 1820) at seven, others at twenty-two, others even at more milliards of marks.

Another question would be to what extent the sum flowing back, under the laws of descent, to the old country, serve to balance the account between the old and the new country.

MILITARY SERVICE.

If in former years, say prior to 1866, the burden of military service was borne unequally by the several German states,* this was no longer the case after the war of 1866, and there, where the innovation was more sensibly felt, military service must be regarded as a cause of emigration. After the war of 1870-'71 this applies also to Alsace-Lorraine. In fact the latter country, and after 1866 Hanover, had long lists of young people who tried to avoid military service by emigration. But this state of things has much changed since the general introduction of uniform liability to military service in all states of the German Empire has become customary. Of course no rule without exceptions.

Generally, Germans are fond of military matters. From the oldest times, when they first appeared in history, to the lansquenets of the Middle Ages and down to the present day, Germans have been known as brave warriors.

Throughout Germany there is now a well-connected net-work of so-called *Krieger-Vereine* (Warriors' Unions) of at least half a million in number, possessing a firm organization, with the express object of supporting order and the welfare of the "Fatherland."

The influence of a military training is observable in Germany everywhere. Everybody can make the same observation.

Every able-bodied, moral young man, whether rich or poor, high or low in social standing, has to pass through the same school of strict obedience, order, promptitude, and faithful fulfillment of duties. How many an uncouth and feeble lad from the country has by such service become a manly, versatile, and orderly fellow.

Convinced that there is no true liberty without order and subordination, they transplant such principles into their civil life, into their families. The husband is in Germany the head of his house; wife and children range according to their natural standing and duties.

TAXATION.

To what degree taxation induces to emigration can hardly be stated. If business is good and incomes are sufficient, of course the collector of taxes meets with but little difficulty, but if their suppositions do not hold true, the collector of taxes is to the common people a dreaded person, who appears often where there is no farthing in the purse. Then a notice is left that if taxes have not been paid within a short time thereafter execution shall take place.

Prince Bismarck read some years ago an amusing number of such executions to the Reichstag, which had taken place, especially in the larger cities; and he did so to induce the Reichstag to decide in favor of indirect taxation, or, at least, of abolishing class taxes collected on a lower amount of income than 1,200 marks.

As all direct taxes cause much complaint and uneasiness, particularly among lower classes of people, the German Government has repeatedly declared that it is their earnest endeavor to gradually transform direct into indirect taxation by increasing import duties and taxes on tobacco and whisky, but these efforts have had as yet but little result, as such measures are much opposed by the Liberal and "Centrum" majority of the present Reichstag, which seems to fear that direct taxation would place a greater financial and political power in the hands of the Government than would be consistent with the rights of the Reichstag to provide every year for the necessary appropriations of the budget.

CLASS TAX.

In Prussia all persons having an income less than 900 marks (\$214) are exempt from class tax, while persons with an income of from 900 to 1,050 marks pay 9 marks per year; 1,050 to 1,200 marks, pay 12 marks; 1,200 to 1,350 marks, pay 18 marks; 1,350 to 1,500 marks, pay 24 marks; 1,500 to 1,650 marks, pay 30 marks; 1,650 to 1,800 marks, pay 36 marks; 1,800 to 2,100 marks, pay 42 marks; 2,100 to 2,400 marks, pay 48 marks; 2,400 to 2,700 marks, pay 60 marks; 2,900 to 3,000 marks, pay 72 marks. Higher incomes pay a so-called state income tax. The income tax is levied on the income derived from (1) real estate; (2) capital; (3) trade, business, or from any paying occupation.

TRADE TAX.

in one class at a certain place, and the medium from the total of such tax hitherto paid is found to be 30 marks, the amount of the tax will be for the next fiscal year $30 \times 80 = 2,400$ marks.

In case the tax-payer is not able to pay the medium tax, a lower rate is granted him, and the amount falling short is added to the taxes of the other rate-payers, but the total of 2,400 marks must be paid by all the 80 trade-tax payers, no matter at what percentage each of them shares in this total, previously estimated and fixed by a committee of members, a moiety of which is chosen from the respective class of trade-tax payers, and the other moiety appointed by the Government.

This system is rather complicated.

TAX ON BUILDINGS.

This tax is paid for all buildings, court-yards and house-gardens belonging thereto, if their area exceeds 25 acres 53 square meters (1 Prussian morgen equal to about 1 acre, 1 rood, 1 perch) in extent. Exempt therefrom are all public edifices of state, churches, schools. Tax is paid at the rate of 4 per cent. on the premiums derived from rentals of dwelling-houses, while 2 per cent. is paid on revenue from buildings devoted to industrial and commercial purposes.

TAX ON LANDED ESTATES.

This (ground tax) is paid in Prussia at the average rate of 9.50 per cent. on the net proceeds of such estates. Real estates belonging to the state and other commonwealths are exempt. In addition to these taxes collected for the state, the communes are under law permitted to collect so-called municipal taxes to defray the expenditures for local purposes. Many cities continue to levy an excise laid on articles of food (mill-ground articles, cattle, meat), imported for consumption (*Mahl- und Schlachtsteuer*). In Berlin this excise is not collected, but it derives its revenues from three other kinds of taxes, viz, from—

(a) *House tax*.—Paid by the owners of the houses, at present at the rate of $2\frac{1}{2}$ per cent. of the amount of rentals received, and

(b) *Rent tax*.—Paid by the tenants at the rate of about $6\frac{2}{3}$ per cent. of the amount of rental paid.

(c) *Municipal income tax*.—This is collected mostly at the rate of 100 per cent. of the amount of class or state tax paid.

School moneys are no longer collected in nearly all the larger cities, though in the country this is still the case.

GERMAN EMIGRATION LAWS.

CONSTITUTIONAL PROVISIONS.

An unrestricted right to emigrate was provided for under the constitution framed for the German Empire as it existed for a short time, 1848-'49.

The constitution afterwards adopted by the individual states of Germany recognized likewise the right of one, but

footing. Permission to emigrate shall be refused to them if they are called in for actual service.

With regard to infants, insane, and other persons having no political capacities at all, emigration can be restricted in all cases where the fulfillment of liabilities under the civil law may be frustrated by emigration.

According to Article 4 of the constitution of the present German Empire, the latter shall be competent in all matters of emigration under the state law, penal and civil law.

THE CIVIL LAW.

The civil law (administration, police law) refers to the emigrant taking with him his family and property, the (licensed) emigration agent, as representative of the ship-owner, the ship-owner himself, master, and crew of the vessel.

Under the civil right the basis of emigration is an agreement, in which the mutual services and liabilities both of the ship-owner and the emigrant are defined, such as charges for passage, manner of lodging, embarkment, landing, board during passage, obedience to shipping regulations, reimbursement or forfeit of passage fare, extent of admissible luggage, &c.

It lies in the nature of things that the contracting parties do not stand on the footing of equality.

Therefore the state has to regulate the contents of the emigration contracts, so that the ship-owner, by abusing his technical superiority, cannot liberate himself from a responsibility incumbent naturally upon him.

The minimum of his liabilities towards the emigrant is therefore regulated by law to the exclusion of all private agreements contravening. Upon the emigration police the following duties are enjoined: Emigration agencies are to be controlled, to prevent fraudulent enticements and fleecing of inexperienced persons; further, the treatment of emigrants at the ports of embarkment and when on board, where moral interests, in a sexual respect, apart from hygiene, shall be taken care of.

Under the German penal code illicit emigration of persons of an age liable to military service shall be cognizable by a fine of from 150 to 3,000 marks, and by confiscation of their property for the payment of such fine, especially in cases where the highest amount of fine has been imposed; while a minute-man (*Reservist*) on leave of absence (*Beurlaubt*), or *Landwehrmann* (man of second levy), who emigrates without the permission and knowledge of his superior military authorities, shall be fined a sum of not exceeding 150 marks.

Desertion, of course, is punished as such according to the provisions of severe martial law.

EMIGRATION AGENTS.

As above stated, the supervision over and legislation on emigration is the prerogative of the Empire; thus, in 1874, an im-

In addition to the supervisory powers of the Empire, many laws of the several German states continue to remain applicable. Their chief principles are stated to be as follows:

(1) Persons to engage in the acquisition and transportation of emigrants shall be bound to obtain first a license as such from their respective Governments, and to deposit bonds to warrant faithful fulfillment of all their liabilities to state and emigrants.

(2) Keeping of books as prescribed by law, subject to the inspection of the authorities.

(3) A series of special quantities for a faithful performance of the contract, which has to contain certain articles prescribed by law; for instance, that each party interested has to receive an exemplified copy of such contract, liability of the agent and his principal for accidents during the passage (delay, naufrage), and a corresponding security by special bond or insurance.

(4) Taking care of good and suitable condition and equipment (spaciousness, sufficient and good supply of provisions) of emigrant vessels.

In summing up this part of my report I wish to state that nobody is prevented from emigrating who has freed himself, in the legal form, of all his liabilities to the Empire, state, and private persons.

EMIGRATION TO THE UNITED STATES NOT LIKED.

Complaints are raised that the stream of emigrants was not in proper times systematically directed to countries where they could have remained Germans and have become consumers and not producers of German commodities.

The colonial policy adopted in recent time is therefore intended to make up for the alleged loss hitherto sustained. As a rule, leading German circles are no longer in favor of Germans emigrating to the United States and Canada. To what extent and by what influences emigration, as appears from inclosure A, in the last five years (and in each of these years more) was checked can hardly be stated. In 1885 the number of emigrants was 103,642, as against 210,547 in 1881.

In my last annual report I said:

This considerable decrease in 1885 seems to show that either the economical condition of Germany has improved, and that the attractive power of America, which heretofore took the largest portion of emigrants, has diminished, or that the new colonial policy of Bismarck keeps many on the fence.

This still proves true. Since then a new measure was adopted by the Prussian Government relating to colonization at home.

The eastern provinces of Prussia and Posen, especially in districts where there is a mixed population (Polish and German), showed not only the highest number of emigrants and thinnest population, but also the lowest degree of industry and worst condition of farming, though they have a more fertile soil than many other provinces. The circumstances that the percentage of Germans, as compared with Poles, diminished constantly attracted the attention of the authorities, and it was finally found that the impossibility of many sons of German farmers, &c., considering the many large manorial estates, to get an independent husbandry and homestead, drove many valuable elements away, leaving behind a not desirable class of people.

Now, recently Prussian legislative bodies have passed a law appropriating 100,000,000 marks for

STRIKES.

It could hardly be asserted that strikes lead to emigration, since the very best and most needed classes of artisans, for instance those engaged in the building trade, have been making efforts to raise their wages still farther by means of strikes, while the least paid are those working classes who can easily be substituted by others. Those belonging to the former classes require a more robust constitution, and are not so numerous as the latter. So their larger number causes a greater competition for work in certain branches, resulting in lowering wages so much needed for the most indispensable necessities of life. Thus the latter have no means to emigrate.

Several strikes have this year taken place in Berlin, but they turned out only to a very inconsiderable extent in favor of the strikers. Regarding the result of the strike of the journeymen masons in Berlin the organ of the German builders (*Baugewerbe-Zeitung*) says:

Their strike is at an end, and it has not had the desired effect of establishing the minimum wages of 50 pfennigs (11.9 cents) per hour. In fact no minimum wages were established at all, but journeymen received pay according to their ability. At present about 5 per cent. receive less than 45 pfennigs (10.7 cents), per hour, 45 per cent. receive 45 pfennigs (10.7 cents), 45 per cent. 50 pfennigs (11.9 cents), and about 5 per cent. more than 50 pfennigs (11.9 cents) per hour.

The strike was ineffective; there were always plenty of journeymen masons ready to go to work on the buildings where the striking workmen had quit and these newly employed journeymen received the protection of the police; consequently the strike was in every case of short duration.

It has also been established without a doubt that the large majority of journeymen masons in Berlin care little for the continuation of strikes or prolongation of useless agitation. The journeymen have frequently expressed themselves as thoroughly contented with the energetic measures of the police which enables them to work undisturbed and to exercise their own inclinations.

EFFECTS OF EMIGRATION ON GERMANY.

Herzog, speaking on this subject, says:

No doubt exists that Germany thereby sustains a heavy loss of population.

Another author, Scherzer, estimates the total emigration as follows.

	Persons.
1821-'30	8,000
1831-'40	177,000
1841-'50	485,000
1851-'60	1,130,000
1861-'70	970,000
Total, 1821-'70	2,770,000
According to official returns:	
1871-'80	595,151
1881-'85	817,778
Total, 1821-'85	4,182,929 + 63,183 via Havre.

Herzog goes on to say:

During the last four years (1879-'83) alone Germany gave off more emigrants to her whole army on the peace footing amounts to the highest working

I am informed that it has become customary in Germany during the recent years to give soldiers in actual service leave of absence to assist such farmers as make application for help during harvest.

As for the favorable effects, Herzog says further :

They are best illustrated by the simile of a too-densely grown wheat-field or forest preservation, in which, by removing part of plants, room and light are created for the remainder. If we bear in mind that the 4,000,000 who since 1820 left Germany for the United States should have remained in the "Fatherland," and been fertile and increased in number, the German Empire would have at present most probably a large number of population than the United States, but it would nevertheless be probable that the majority would have to conduct a mode of living under worse conditions than they are at present. If this favorable effect of emigration can but with difficulty be ascertained in detail, another advantage can easily be recognized, namely, the one which a permanent connection of the emigrants with the former home brings on for commerce and industry. This connection is stronger and more durable than generally supposed. Even if the emigrant renounces his nationality; nay, even if he loses the use of his mother tongue, the economical relations continue to subsist with great tenacity. The considerable extent of the German exports to the United States, Brazil, and Chili is in the main caused by the larger number of German immigrants.

Knowledge of the locality where to buy goods, national customs and habits, and a predilection for their old home contributes to decide would-be purchasers in favor of the old native country. The ways once being opened to commerce the relations between the two countries are easily maintained and strengthened.

GERMAN EMIGRATION TO SOUTH AMERICA DESIRED AND FOSTERED.

Great efforts have of late been made by German colonial and other associations to give the stream of German emigrants another direction than to the United States, where they say German nationality and language is easily lost in the intercourse with a kindred tribe and idiom. Great hopes are therefore entertained with regard to the three southern states, Brazil, Uruguay, and Paraguay, having vast fertile districts with a population next to nothing, situated under a temperately warm sun. The opinions of scientific explorers and practical men have confirmed that from the nature of agricultural produce obtained there, these states, as well as Argentine, would not, like North America, serve to make German immigrants formidable competitors in the production of breadstuffs, while, by and by, they would become valuable customers for German manufactures.

It is also claimed that the natives of South Brazil, with their idiom, their manners, and customs are more foreign to German immigrants than the United States, retarding amalgamation with the native element. To prove this, attention is directed to the development of three Brazilian provinces, Rio Grande do Sul, Parana, and Santa Catharina. About 200,000 Germans have settled here, steadily increasing in number, both by births and new immigrants from Germany, but retaining their German language and manners in church and school.

GERMAN COLONIES.

German colonies have as yet, except perhaps the acquisitions in the South Sea (New Guinea, &c.), not been deemed proper fields for German farmers; but as purveyors of raw material and colonial and such goods as are not produced in Germany, they are likely to become an important

CONDITION AT HOME.

The general condition of the German people at home, especially in reference to those classes which contribute largely to the number of emigrants, viz, farmers, agricultural laborers, and artisans, I shall attempt to state, and, in addition to the information above given, some other features.

The decline of German farming is a subject much discussed in Germany.

For a better understanding of the mode of farming, it may be well to say that German agriculturists make a distinction between large landed estates with net proceeds of at least 1,500 marks per year, consuming only the smallest portion of their produce.

Mittelgüter (landed estates of about 50 to 100 hectares) of arable land under cultivation, with net proceeds of at least 300 marks. Small estates, with 5 to 20 hectares, where the keeping of a plow can still be afforded, with lowest net proceeds of 90 marks, and dwarf (truck) farms (*Zwergwirthschaften*, spade husbandries), where the plow is replaced by the spade, or the work is done with the help of hired teams.

Compound estates (*Gütergemenge*) where a whole tract of land, under the superintendence of an official surveyor, was subdivided into a number of triangles, the owners or farmers of which constitute the inhabitants of a village. The term *Gütergemenge* is used in contradistinction to the old German *Hofwirthschaft* (domain husbandry), where the estate forms a whole, in the center of which the husbandman resides, as it is still the case in Schleswig, Oldenburg, East Frisia, and Westphalia.

Large husbandries, surrounded by smaller and spade husbandries, exercise a beneficial influence upon the whole developement of culture of the surrounding population by their perfecting the cattle-breeding; by the introduction of better and newer modes of cultivation; by the storage of supplies, and, in many cases, by grand industrial trades connected therewith (manufacture of spirits, sugar, starch, &c.), and by furnishing to manufacturers and cities large quantities of superfluous products and raw materials.

In times of failure and death their usefulness is quite obvious. An agriculturist (Poussanie) says :

With all the greater well-governed nations of an old civilization, a gradation of husbandries from the smallest tract of land up to the large estate should exist everywhere, so that every individual should have a chance of improvement. For with maxims of an old civilization, a high degree of individual and general progress can exist only when they develop their forces harmonically, i. e., if they have fostered agriculture, industry, and commerce in reasonable proportion, or, in other words, if they have realized a subdivision of labor in the most perfect manner.

THRIFT OF HUSBANDRY.

Considering the heavy pressure which, according to the same expert, for centuries, except in Northern and Eastern Prussia, weighed upon agricultural laborers, and the present progress of transformation of all political, social, and economic conditions of Germany, a reasonable and saving husbandry at times, when on the most estates expenses have

land, cheap fuel; in case of sickness, medical treatment free of charge; sickness-funds; further life insurance, and insurance of chattels against fire should be provided for them.

As already stated, the Reichstag has this year passed the bill to extend the benefits of the so-called *Unfallversicherungs-Gesetz* (insurance in case of accident) to agricultural and forest laborers. In other respects the ideas above suggested have already found application on some of the larger estates.

KIND OF INCOME OF AGRICULTURAL LABORERS, ETC.

In Germany there are three classes of them: Free day laborers, receiving mostly wages in money, and partly conducting a migratory life according to season and place of employment found, while servants and contract day laborers receive compensation in land let out, produce, and in money. They are engaged per year or even for a longer period. Contract day laborers are mostly found on large manorial estates.

Household budgets and rates of wages of such day laborers are published in the report of my predecessor, Mr. Brewer (see pages 210 and 211, Vol. I, Europe Labor Report, 1884). Wages have hardly much changed since then.

The material condition of these laborers is stated to have much improved as compared with a state of things twenty or thirty years ago. The prices of so-called colonial goods (sugar, coffee, spice), and especially of clothing material, have not risen in the same proportion as wages.

Most of these laborers either produce themselves or receive wages in produce, namely, breadstuffs, potatoes, milk, meat, fuel, and dwelling.

Laborers owning land have generally houses of their own. On their land they cultivate potatoes, vegetables; produce in their own husbandry milk, meat (especially pork), eggs, &c. They mostly bring up more hogs, fed by the waste produce, than they want for their own consumption. When fat, the hog is sold in the next market, and out of the money of sale they increase their live stock. It was especially in their favor that higher duties on imported meat and lard were introduced by the German Government. The present price of pork is 50 to 70 pfennigs per 1 pound ($\frac{1}{2}$ kilogram) in Berlin (against 55 and 75 pfennigs in 1876), and for lard at present 33 pfennigs against 80 pfennigs in 1876.

With all the laborers, also with those who hired only a tract of land, the wages in money serve materially to cover such necessities of life where a rise of price took place only in an insignificant manner.

The condition of dwellings, especially on the manorial estates of Northern Germany, has much improved.

As for morals, complaints are often raised of the laborers becoming less economical and more pretentious. Others have noticed in some districts a greater propensity for spirituous liquors; in Posen, Prussia, and Silesia, for brandies; in Southern Germany, for beer. In some counties, neighboring large cities, a spirit of opposition and discontent is noticed, mostly inspired by socialistic doctrines.

Mental education is stated to be improving. The
not able to read or write is

CONDITION OF INDUSTRIAL LABORERS.

The recent riots and labor disturbances in England, Italy, France, America, and particularly in Belgium, have again directed the attention to the socialistic problem still waiting for a solution satisfactory to all parties concerned.

It has not escaped my attention that in Germany the socialistic agitation has been comparatively of a quiet character. This may be due partly to a more discreet leadership, partly to the vigilance of a strong Government, partly to a regular employment, and finally to certain protective measures inaugurated for the benefit of the workmen. In 1883 an act was passed providing for the insurance of working men in case of sickness. Another act was passed in 1884 to insure in case of accidents industrial workmen (about 4,000,000 in number); this latter act has this year been extended to agricultural and forest laborers (about 14,000,000 in number), while another act was passed for indemnification of officials of the Empire in cases of accident. Besides this, a bill to protect all working men in old age is under contemplation.

If true causes of just grievances of laborers and practical means could be found to remedy all evils resulting therefrom it would be an easy task to remove the effects. In many, if not in most of cases, it is the permanent agitation of the socialistic leaders who make a living on the small contributions paid by the numerous members of the Laborers' Union organized by them. But under the act against dangerous pursuits of social democracy the German Government proceeds energetically against the instigators, expelling them from places where, as in Berlin, Leipzig, Hamburg, and recently in Spremberg, the state of small siege has been proclaimed. But several points of their complaint deserve, at any rate, our attention. One author, Schippel, speaking on this subject, says:

A surplus of goods of all kinds beside a surplus of privations—that is the signature of the present time; placed amidst an exuberant plenty of goods, the people long with sorrow for daily bread.

Everywhere productivity or susceptibility of production has grown beyond the increase of population. Our forefathers would have thought it impossible that overproduction, even of breadstuffs, could ever assume such an extent on the whole globe.

Another author, Professor Reuleaux, the well-renowned author of "Kynematik," in a very interesting treatise on the "Machine and the Social Question," points to very noticeable features of the question, some of which are herewith rendered in translation.

He goes on to state that the fact that industry steadily creates a surplus of manufactures is but natural. The labor question owes its existence to the extraordinary amount of work that can be done by machine with a comparatively very slight consumption of human force.

House or home industry distributed over a country disappears, and concentration of labor, with all tools belonging thereto, ensues on certain places, accumulating masses of people in a condition gradually

In large cities, like Berlin, the lack of clever artisans is already perceptibly felt; but what strikes even more attention is a deplorable diminution of the skill itself of the operatives. Nearly every new invention tries to deprive the remainder of work from laborers still done by hand. Not only are adult workingmen lowered to a position of mere machine helpers, but even this very position is uncertain, as the same could be easily filled by children. This serves, again, to press down wages to a level hardly sufficient to live on.

And while the machine requires the laborer's full and close attention, he has no occasion to apply and exercise his natural gifts in producing works, nor can he, under such circumstances, train and strengthen his physical, intellectual, and moral powers. It is but an act of grace if employers allow him at times to change the kind of service or of the machine to be attended by him.

Reuleaux says:

The two great organizations for horizontal transportation of goods, steam navigation and railroading, exhibit applications of the steam engine which do not entail a suite of detriment to the laborers concerned; both institutions have rendered to society the very greatest services. The bridging of the seas by steamboats, the connection of countries by railroads, the speed of movement taking place on both ways, have entirely transformed the life of nations.

To these institutions of transportation serves a very considerable fraction of the laboring classes, and that under circumstances which, in the principle, are not oppressive, not degrading, not detrimental to health; on the contrary, as a rule, are very favorable. Here there is no labor question, or, if same has been forcibly created, does not possess a like dark background of the condition of workingmen as in other branches.

Like favorable, but at least not unfavorable conditions are found in the line of large machine works, there where locomotive engines, steam engines, railroad cars, ship machines, boilers, vessels, &c., are built. Here, on an average, the workman has a wholesome, though toilsome, not too monotonous and paying employment in the service of the steam engine. The good with which many German manufacturers and managers have come to meet any reasonable wants of their laborers, have been attended with blissful results.

It would now be the task of mechanics to accede to the question, whether and in what manner, in the province of machinery, could be contributed to a cure of evils which machinery has inflicted upon society additionally to its good gifts.

During the last decennial that kind of working machines and whole trains of such machines have been taken into use, which bring, so to say, the working of an article to be made to a complete and full finish, in which the work of regulation for the most part is no longer done by human hand. The consequence thereof is that for the production of an article of a very high quality only an inferior workingman is required.

On the occasion of the Paris International Exhibition, Professor Reuleaux called attention to this kind of production, calling articles exclusively made by machines, "machinofactures," in contradistinction from "manufactures," *i. e.*, articles made or finished by hand, or where skill of the laborers in treating and using machines is still wanted to a great extent. Then Professor Reuleaux goes on to show that especially there where "machinofactures" are produced, it can be noticed how the laborer is gradually surrendered to capital.

A steam engine acts so much the more favorably, *i. e.*, more economically, as it is larger.

The same has, therefore, a natural tendency of increasing in bulk and efficiency. An industry furnishing a simple product, such as calico, must therefore, of necessity, fall to the capital, as this alone is able to establish those grand plants, the operation of which admits of prodigious quantities of the market.

certain places. It is remarkable that in the domain of weaving or of fibrous stuffs industry generally, the forcible means of strikes was of no good whatever to the strikers. He says:

If we, however, look somewhat more closely at this very question of weaving, we observe that not so much the tool, the loom procurable at lower rates, as the purveyor of force, the steam engine, afforded the preponderance to the capital. Only this latter is able to procure and to run those huge and powerful steam engines of our days, around which the remainder of the establishment or plant, though also wanting capital, is grouped, though not in such a manner that these appendices could not be detached or separated therefrom. From this very cause the weaving trade, though under hunger and sorrow, has succeeded for so long a time to stand the force of the steam engine.

Here we stand evidently in the face of a principle. The working machine is, in a great many instances, not a dynamical unit, but divisible finds application in one and the same works in many equipollent repetitions, only loosely kept together by the steam engine.

The single working machines have no exorbitant price; on the contrary, the "machinofacture" of machine builders is about to furnish same in an increasing perfection cheaper and cheaper.

Therefore, in cases where these conditions meet, there is a chance to militate against the undesirable preponderance of the capital that is to make force independent of capital.

The small weaver would be saved from the overpressure of capital if we could give him that portion of elementary working power necessary for his loom. Similar attempts could be made with regard to spinners, but much more to the trades of joiners, locksmiths, tinsmiths, brush-makers, pump-makers, and the like.

What these trades want is partly power, partly working machines; but these latter could, even now, be procured by the artisan, as they can be had at really cheap prices, but what he wants is motive power for work at home.

Then they could do their work at home just as well as in the factory, which attracted them, and in utilizing his train of machines in various ways he would retain or regain his skill. Able to compete, the small master would be, in spite of certain advantage which large manufacturers have, for the reason that when working at his home the mutual assistance of the members of his family in general, the moral element, will be added to his well-being as a most efficient factor.

Thus the small manufacturer, with his assistants and apprentices around him, would form a closed working organism, with superior and subordinate forces, resembling the former mode of living of mechanics or artisans. And had all these small manufacturers once become able to compete their quality would quickly improve, as in the same moment also the market for laborers wanted for large manufacturers, i. e., for the capital, would experience an improvement.

The capital would thereby lose the attraction to proceed to manufacture articles which can be easily supplied by small workshops.

Thus the tendency of the capital to concentration could be neutralized. What engineers and machine works have to do to remedy an essential part of social evils, is the production of cheap, slight working power, or, in other words, small power machines to be operated at small expense.

Several excellent types of such machines can already be found—gas-power machines, hot-air machines, small water-pressure machines, petroleum-gas machines, &c.

Several days ago, one Julius Spiel, Berlin, appeared at this office, in a patent matter for petroleum and gas machines of that kind. He informed me that a large company is constituting to manufacture that type of machine.

Professor Reuleaux's views, above given in substance, remarkably agree with a portion of a lecture delivered by I. C. Bayles, as president of the American Institute of Mining Engineers, at the meeting of Hali-September, 1885, where he says:

partouts, and other light picture frames, and fine confectionery. These men earn more money and live better than they possibly could as wage-earners in the large manufacturing establishments of the city.

HAND WEAVING *versus* MACHINE WEAVING.

A noteworthy gathering of weavers took place November 1 in the city of Elberfeld. The deplorable state of poverty among the hand weavers, as well on the Lower Rhine as in the valley of the Wüpper, is well known. The introduction of machine weaving has greatly damaged the once thriving business of hand weaving, even to such an extent that the Prussian Government has taken the matter into consideration.

The object of this meeting of the weavers was to take measures which may improve this sad state of affairs.

It was resolved to send a petition to the Reichstag with the following demands:

(1) A taxation to be placed on machine-weaving under international treaties.

(2) Limitation of the same through the fixing of a maximum time for such a day.

(3) Abolition of married women labor, and prohibition of labor by children under sixteen years.

(4) Abolition of prison labor and convict labor competition.

It is a notable fact that Mr. Gebhard, a manufacturer and counselor of commerce, representing the Elberfeld Board of Trade, accepted the demands of the weavers, provided they can be made an international regulation.

WAGES.

I am informed that, as a rule, wages have in recent years nearly kept on the same level. Efforts were made by laborers of the building trade, as hereafter will be more fully described, but with doubtful results. I inclose a comparative statement showing the average rates per week paid in Berlin during the years 1882, 1884, 1885, as far as a comparison was practical.

No change has certainly been noticed with regard to unskilled day laborers in Prussia and the Hanseatic cities. I inclose a table showing their daily wages received at different cities, giving the average wages both for adult and young, male and female persons. These statistics are taken from the *Concordia*, published at Mayence, and are stated to be based on official publications.

Able men do not lack employment, and, as already stated in my last annual report, their mode of living has not been worse; on the contrary, the prices of provisions have since again shown a decline.

A NORMAL BUDGET OF A BERLIN LABORER.

According to a computation recently prepared by a social association of Berlin, a workman's family, consisting of husband, wife, and two children, keeping up quite a simple mode of living, and confining themselves to the very greatest necessities of life, paid per year for provisions 51.9 marks (\$123.52); rent, tax, and fuel, 27.7 marks (\$65.92); clothing, shoes, and underclothing, 30.4 marks (\$72.35); total 110.0 marks (\$261.82).

which must mostly be made up by the earnings of the wife, and, if age permits, of children.

For more example, I beg leave to refer to Report No. 110, dated May 25, 1884, of Mr. Brewer, my predecessor, where Berlin household budgets of different kinds of working people have been reported. No striking change in the mode of living has since been noticed.

In a report of the Prussian superintendent over factories at Dusseldorf I found another statement, which I herewith inclose, as to the weekly consumption of a workman's family during winter. He accompanies same with some observations. He says:

If we take into consideration that an operative engaged in coarse works wants for his own person per year at least 3 blouses, each 42 to 47 cents; 3 pairs of trousers, at 71.4 cents, \$2.33; 8 to 10 pairs of stockings, at 23.8 cents, \$1.90 to \$2.38; 3 to 4 pairs of wooden shoes (sabots), at 14 cents, 42 to 56 cents; 1 or 2 pairs of leather shoes, at \$2.38 to \$7.14; add to these items expenses for taxes, school moneys, school books and the like; 50 pfennigs per week for yarn, &c., for repair; 6 marks per year for fresh bed-straw, it is obvious that a laborer with a large family, living at a larger place, earning on an average 3.50 marks (83 cents) a day, is unable to incur the expenses set forth in the annexed table, but has considerably to reduce them.

He further reports that in many cases operatives in a certain city stated to him that a family of five members, earning wages of about 3.25 marks (77.3 cents) per day, could hardly make both ends meet, but when earning only 3 marks (71.4 cents) this would be impossible without serious privations.

In the country, especially if other favorable conditions permit that a little land is rented and a goat kept, it can be more easily afforded to get tolerably well along with 3 marks of daily wages. But even in this case the limit where privations begin lies far beyond the rate of 2 marks (47.6 cents) a day. I give here two examples:

A locksmith, having a very economical wife, another member of the family earning wages, and five members not yet wage-earners, earned 682 marks (\$162) per year.

"Nobody," he declared, "had to suffer hunger, but at times we were short of means for support."

A silk-weaver, whose family consisted, beside himself, of wife and three little children, earned, on an average, about 14.30 marks (\$3.40) a week, stated that since his marriage, seven years ago, he has not been able to buy a coat; and though his wife understands housekeeping better than the majority of workmen's wives, he does not get rid of his debts for mere bread.

Of a more considerable influence than usually thought upon the laborers making both ends to meet, is the reliableness, regularity, and promptitude of the wages received.

A workman, formerly earning an average day's wage of 3.25 marks (\$1.73), could not get free of debts and satisfy promptly the wants of his family, because of the considerable fluctuations in day's wages; their payments were made every fortnight, while a week's pay was retained, but can now do so very well, having become invalid, and as such deriving his revenue every quarter, earning something besides, the whole income amounting only to 2.85 marks (67.8 cents).

Another report of a superintendent over the manufacturing districts in the province of Brandenburg (Berlin excepted) says as follows:

"Movements for higher wages, called forth by similar movements in Berlin, showed nowhere a permanent result, so that the rate of wages during the last two years has remained on the same scale. But it seems that, considering the efficiency of our industries to compete, wages have obtained, for the present at least, their highest mark. Best wages received:

Occupation.	Wages per week.	Equivalent in United States currency.

THE DEMANDS OF SOCIAL DEMOCRATIC LABORERS.

In a meeting of unemployed workmen in Berlin, on the 25th of January last, which was attended by about one thousand persons, it was greatly deplored that so many people in Berlin were without work, and that their number was constantly increasing. One of the speakers, Goerchi, a leader of Social Democrats, said some "bourgeois" claimed that the lack of employment was caused by "overproduction." "This word 'overproduction,'" he said, "was an invention of those same bourgeois. The lack of employment," said he, "was caused chiefly by the inability of the people to buy, and this was caused by a production at the mercy of capitalists." The natural consequences of such production must of necessity bring about an ever-recurring crisis and cause perpetual poverty among the masses of workingmen. The tendency of present production is to cheapen all articles of manufacture, and still the people are for the most part unable to buy the absolute necessities of life. The reduction in the price of manufactures was brought about by reduction of the workingmen's pay. The reduction in the pay for work brought cheap female labor into prominence, to the detriment of male labor.

Female labor was the principal cause of the present lack of employment. For the sake of morality, household regularity, &c., female labor in factories should be prohibited or at least restricted, &c.

Female labor at night is employed in glass-works, mirror factories, in works manufacturing coal-dust, bricks, cement, cast iron, and zinc, porcelain knobs, paper, pasteboard, in wood-grinding, spinning and weaving mills, cloth, flannel works, in worsted spinning, net-work factories, chemical works, sugar refineries, starch works, newspaper press-rooms.

In these branches of industry, where day and night labor is carried on during the whole year, the number of females who work at night is about as follows in the different German states:

German states.	No. of establishments.	No. female employés.
Prussia	191	3, 161
Bavaria.....	6	171
Württemberg	2	80
Baden	2	40
Brunswick	2	9
Saxe-Meiningen	2	120
Lippe-Detmold	5	51
Saxe-Altenburg	1	20
Bremen.....	2	8
Hamburg.....	2	4
Alsace-Lorraine	6	376
Total	222	4, 080

In branches of industries where only during a certain time of the year (campaign) business is carried on, but in this case regularly at day and

night, the number of females employed (in works manufacturing beet-sugar, sauerkraut, bricks and tiles, earthenware) were as follows:

In sugar works.

States.	No. of establishments.	No. female employés.
Prussia.....	236	6,500
Bavaria.....	1	18
Baden.....	1	50
Mecklenburg-Schwerin.....	3	20
Saxe-Weimar.....	3	54
Brunswick.....	30	450
Saxe-Meiningen.....	1	10
Saxe-Coburg-Gotha.....	1	24
Anhalt.....	28	610
Schwarzburg-Sondershausen.....	1	28
Schwarzburg-Rudolstadt.....	1	22
Total.....	306	7,796

In the following branches of industries female labor is employed at night only in regularly recurring times (season work), while during the remaining part of the year only day work is done: Works manufacturing articles of lead, wood, carving material, carpets, hosiery, umbrellas, toys, in dyeing works, cloth-refining and finishing works, works making ginger-bread, preserves, and pickled meats. There are in Prussia eleven works, employing 515 females; in Reuss Gere three works, employing 200 females.

In the textile and paper industries females work only at night at specially urgent business times.

INSTRUCTION OF FACTORY GIRLS IN MANUAL LABOR, ETC.

Even Duceptians and Leplay denoted ignorance of the wives of workmen regarding all kind of manual labor and household work as the principal cause of the poverty, misery, and moral depravity which unfortunately is so prevalent among the laboring families. And since the time when these great political economists first called the attention of an enlightened public to this deplorable state of affairs, matters have not improved. It is comparatively rare to find the wife of a working-man able to cook, sew, knit, and mend torn garments, or to do such work as is of vast importance for the welfare of the poorer classes. The consequence is that the laborer who returns from his daily work finds, instead of a palatable meal, some kind of mixture which it is hardly to be expected he will relish.

A further consequence is that instead of cleanliness and order in their dwellings, filth and disorder reign, which create a distaste in the laborer for his home, and he prefers to spend his evenings in taverns and drinking-places.

A remedy against such evils can only be expected when factory girls have a chance to acquire the knowledge through the necessary instruction. Such training

wives and mothers. Instructions are given during evenings, so that those who work in factories need not neglect their daily occupation.

Similar establishments have been opened at Worms, in Hanover, and Westphalia.

But success will be possible if they become general. It is not necessary that each employer establish such a school; it would be an easy matter if several employers create them jointly.

It lies in the line of temperance societies to suggest and support these institutions, and ladies' societies will sympathize with their introduction. This opens a vast field for the charity of high-standing ladies.

A well-known political economist is of opinion that the wives of employers can have the greatest influence in elevating the female working-class. The instruction of girls in manual labor and other work of house-keeping would improve also the moral character of inexperienced girls who are at the mercy of so many temptations. But the bliss of such schools would be universal.

BERLIN JOURNEYMEN BUILDERS' FIGHT FOR HIGHER WAGES.

On the 3d of May last a long-threatened strike commenced. On the 9th of May a meeting of at least 4,000 journeymen took place, in which it was resolved that since 161 employers had conceded to their demand of 50 pfennigs (12 cents) per hour, the strike should not be general.

Married journeymen who are at work agreed to pay 1 mark per week and unmarried men 1 mark 50 pfennigs to the strike funds. A resolution that unmarried journeymen who came to Berlin from other cities should leave the city while on a strike was not adopted.

On the other hand, the Berlin Union of Master Builders held on the 5th of May a meeting and adopted a resolution, the substance of which is as follows:

The masters being convinced that strikes, even if they result in favor of one party or the other, are injurious to both parties, have since the beginning of the year done everything in their power to avert them. They could not enter into any negotiations with the so-called commissioners of wages, because, in the first place, this committee was elected by a comparatively small number of the journeymen at work in Berlin; secondly, because this committee will not permit any contract work whatever; thirdly, because all decisions of the committee are to be approved by the entire number of journeymen, which is utterly impossible; and, lastly, because this committee is influenced to a great extent by persons who are not journeymen nor in any way connected with the leading trades.

To bring about harmony among masters and journeymen, the former deemed it expedient to organize a body of masters and journeymen to consult and arbitrate jointly regarding wages, the number of working hours per day, and all matters of their mutual interest and welfare, &c. This manifesto was adopted unanimously and printed in 15,000 copies to be distributed among the journeymen masons of Berlin. It was further adopted to allow 45 pfennigs (10.7 cents) per hour as wages, which can be increased to 50 pfennigs (12 cents) if the work done should merit such an increase; but that 10 hours should under all circumstances constitute a day's work.

As already stated, the masters carried off the victory in the meaning of the above resolutions.

Their first report has recently been made. The same deals exclusively with the first point of said bill, viz, the organization of a board intrusted with the supervision over the execution of protective laws for workingmen; such board should officiate in the name of the Empire, under the title *Reichs-Arbeits-Amt* (work office of the Empire), which should have control over the 200,000 working offices to be created throughout the Empire.

According to the bill, as prepared by the Social Democrats, such "Imperial work office" should consist of an imperial council of labor, with the necessary assistants. Women should be eligible as such. But the imperial work office should have only the right to choose the members for the "Imperial labor council" and of the persons presented by so-called *Arbeitskammern* (chambers of laborers).

This chamber was the main object of the Social Democrats, which is to be a sort of "parliament of laborers." It is to have a voice in all questions appertaining to the politic-economical life of the district concerned, co-operating with the work office in the same district. It should be especially empowered to thoroughly investigate the operations of trade and maritime treaties, duties, taxes, wages, provisions, rentals, competition, schools, polytechnical institutions, collections of patterns and designs, condition of dwellings, hygienic matters, &c., of the laboring classes, &c.

The committee of the Reichstag, after careful deliberation, was of opinion that these propositions were impracticable, and so the same has concluded to substitute the following resolutions to be laid before the Reichstag for assent:

(a) To request the Imperial chancellor to use his influence towards increasing the number of factory inspectors and to decrease the extent of the present districts of factory inspectors for a more thorough supervision of factories.

(b) To request the chancellor to introduce a bill in the Reichstag providing for the obligatory introduction of "trade courts," suggesting that the judges of the same should be elected by an equal number of employers and laborers, in separate election bodies, by a secret ballot.

COLOGNE.

REPORT OF CONSUL WAMER, OF COLOGNE.

Before I proceed to reply more directly to the interrogatories with reference to statistics and other information asked for in Department of State circular dated April 27, 1886, I desire to show the view taken of this matter in Germany, inasmuch as the discussion of this question here at the present day is considered of the utmost importance, more especially since the colonial policy of Germany has been inaugurated. One of the most difficult problems which the German Government has had to deal with in latter years has been the question of emigration. It has been obliged to devise ways and means

During this interval from 1871 to 1885 the emigration of Germans from German ports, Antwerp, and Havre, not reckoning those who emigrated by way of Holland and Great Britain, reached 1,478,887, or more than 20 per cent. of the increase of the population. It is estimated that the emigration during the last sixty years amounted to 4,500,000. Besides the loss of so much body and mental strength, it is computed that in respect to education alone a capital of about 25 milliards has been lost to the nation.

In the year 1881 the emigration reached its climax, amounting to 221,304, or about double the number of the preceding year. This state of things created alarm, and the matter was repeatedly referred to in the German Reichstag. The Government, having hitherto been fencing rather than dealing practically with the question, found it then necessary to devote special attention to the matter. Several remedial measures were proposed, but they failed to overcome the evil.

COLONIAL POLICY.

Under such circumstances the Government resolved to turn the efflux, if possible, into other and new channels, and from that date a colonial policy came into existence. The results of this policy are sufficiently known, but it cannot be said that amongst emigrants these colonization schemes ever found much favor, as the new German settlements offered but a poor trade and altogether few advantages and inducements. Nevertheless associations have been formed in Germany for advocating these colonial projects, their principal object being to divert the flow of emigration from the United States, and to direct the attention of emigrants to other countries, where, as it was hoped, they would do better and need not lose their nationality. One of these societies, the *Kolonial Verein*, held recently an important meeting in Karlsruhe, on which occasion one of the speakers made the following remarks:

It is not to be denied that the 8,000,000 of Germans now living in the United States, consisting of emigrants of two generations, will be able to effect much for the future development of the Union, but still it is true as well that the chances of prospering in the United States are not so favorable as they were twenty or thirty years ago. In the same measure as the chances become poorer we ought, for sake of humanity and policy, devote our labors toward finding for the German emigrant other countries, where he will not only meet with a kind reception and with fair means of existence, but also be able to retain his German nationality, and likewise the German language and his German habits. By such means he keeps up his relationship with Germany. Look, for instance how those three Brazilian provinces, Rio Grande do Sul, Parana, and Santa Catharina, where about 20,000 Germans are living, have developed themselves. These Germans have not only retained their language and habits, their church and school, but the trade is principally in the hands of these Germans, and besides they exercise an important political influence over the provincial government. The emigration to South America, as compared with North America, is so far insignificant. Much, however, is to be said in favor of emigration to South America, and altogether the chances of prosperity are now greater, especially in South Brazil, than in North America.

These societies may and do exercise some influence, but for the present at least the probability is but slight that the majority of emigrants will prefer other countries to the United States. The settled and comfortable homes of so many Germans in the United States, and the free institutions of that country, form an attraction too powerful for the German emigrant to resist.

EMIGRATION FROM EUROPE.

STATISTICS OF EMIGRATION.

The following statistics show the number of emigrants that left Germany, via German ports and Antwerp, during the period from 1871 to 1885, inclusive, and to what country:

TABLE A.

Years.	Total ascertained number of emigrants.	Port of departure.			
		Bremen.	Hamburg.	Stettin.	Antwerp.
1871	75,912	45,658	30,254

1881	206,189	286	56	58	2,102	762	314	35	745
1882	189,373	383	65	39	1,286	1,101	335	40	1,247
1883	159,894	591	52	32	1,583	1,041	772	50	2,104
1884	139,339	728	39	20	1,253	1,276	230	35	666
1885	98,628	692	39	24	1,713	1,576	294	72	604
Total..	1,349,289	3,981	483	940	29,117	10,100	3,223	513	15,268

Of 1,000 emigrants, 955 went to United States; 2.8 to British North America; 0.3 to Mexico and Central America; 0.7 to West Indies; 20.6 to Brazil; 7.1 to other ports of America; 2.3 to Africa; 0.4 to Asia; and 10.8 to Australia.

The foregoing official figures do not include the German emigrants who embarked via Havre, Holland, and Great Britain. Of the two latter I could find no official report. As to Havre, the following are the official numbers of German emigrants from 1871 to 1885:

Years.	No.	Years.	No.
--------	-----	--------	-----

By adding the number of emigrants who went by Havre in the fifteen years to the number who emigrated during the same period by way of German ports and Antwerp, as given in Table A, the total is increased to 1,478,887.

To every 100,000 inhabitants the different provinces of Germany furnished the following quota:

It will be seen by Table A that the total number of emigrants who embarked from the ports of Bremen, Hamburg, Stettin, and Antwerp, amounted to 103,642 during the year 1885. Of this number the age ranges as follows:

Age.	Males.	Females.	Total.
Under one year	2,243	2,322	4,565
From one to six years	4,945	4,765	9,710
From six to ten years	4,772	4,563	9,335
From ten to fourteen years	2,263	2,028	4,291
From fourteen to twenty-one years	10,733	10,322	21,055
From twenty-one to thirty years	16,068	11,710	27,778
From thirty to forty years	7,504	5,364	12,868
From forty to fifty years	3,700	3,191	6,891
From fifty to sixty years	2,203	2,213	4,416
From sixty to seventy years	1,101	1,112	2,213
Above seventy years	213	175	388
Age not ascertained	82	50	132
Total	55,827	47,815	103,642

CLASSES WHICH SUPPLY THE GREATEST NUMBER OF EMIGRANTS.

The greatest number of emigrants is supplied by the agricultural class from comparatively thinly populated districts where they have been able to save a little money. In referring to Table C, it will be seen that Pommerania, Posen, West Prussia, Hanover, and Schleswig-Holstein, principally agricultural sections, furnish the largest contingent of emigrants, while the industrial districts of Westphalia, Rhineland, Silesia, and Saxony, with large populations, furnish less.

CAUSES OF THE EMIGRATION.

The chief causes of the emigration are not to be attributed either to compulsory military service or to onerous taxation, strikes, or over-population. There are, no doubt, some instances where the compulsory military service has led to emigration, but generally speaking the military service is not objected to, but even liked by the majority of high-spirited young men. As a rule they take a pride in the service and are fond of military appearance. According to the opinion which I have formed, I believe that the service, severe as it may be at times, does the young men of this country good; it gives them manly strength, teaches them to be orderly and careful, and instills in them a respect for authority. The cause of emigration is not to be found in a love for adventure, but from a desire of the emigrant to purchase out of his small savings land on more favorable terms than he can do at home, and thus become owner of property—a position which he can very rarely ever hope to attain in his country. The percentage of emigrants from the industrial laboring classes is small, which is no doubt to be attributed to their not being able to save out of their slim earnings a sufficient amount to allow them to emigrate. While they do not earn more than they seem, as a rule, more contented

attention) Professor Eggert* made the following remarks on the subject.

From the earliest ages the Germans have taken to wandering, partly because their own country did not offer them sufficient means of existence, and partly from a desire to become owners of land. This tendency exists to the present day. The agricultural interest has suffered more than that of the trade industries, and consequently the German, weary of waiting for better days, collects his savings and then leaves his country sadly but hopefully in order to seek his fortune in foreign lands, and especially to realize the ideal wish of his life—to become owner of land. These have been and continue to be the reasons which force Germans to leave their country, and in reconciling ourselves to this situation it is best to do all we can to reduce the evil as far as possible, and to turn the matter to some practical good both for Germany and for those who take leave of Germany.

Professor Eggert suggests, in order to prevent emigration, the utilization of the woods and forests, which constitute a fourth part of the area of Germany, by turning them into arable land, meadows, and fields; but according to his own showing such a transformation would take a great number of years, and according to his calculation during that time at least nine-tenths of about the present number would be obliged to emigrate. As this plan would hardly recommend itself, he advises intending emigrants to turn their attention to the German colonies for two reasons; first, land would eventually be obtained for very little outlay without the necessity of denaturalization; and, secondly, such colonization would be useful to the German export trade, consequently a direct benefit to Germany.

SOCIAL CONDITION OF THE PEOPLE.

In my report sent with dispatch dated May 21, 1886,† I gave a fair sketch of the social condition and manner of living of the laboring classes. With respect to the latter, marriage, although contracted sometimes too early, is a great advantage, and it is here that I desire to speak in the highest praise of their industrious and economical wives. They not only attend to their household affairs, but in many instances do much outdoor work, and thereby aid in the support of their families equally as much as their husbands. Indeed, I do not believe that the wives of the work-people of any other nation toil as much as they do in this country.

With regard to divorce and illegitimacy it cannot be laid to the charge of Germany that such evils are of any frequency.

In this connection it may be interesting to give some information as to how the agricultural holdings in the German Empire are apportioned.

The number of farms in the German Empire is given as 5,276,344, amounting to 31,868,972 hectares, or 79,672,430 acres.

The sizes of these farms are classified as follows:

From 0 to 2 ares†	66, 143
2 to 5 ares	195, 298
5 to 20 ares	656, 193
20 to 1 hectare §	1, 405, 682
1 to 2 hectares	738, 515
2 to 5 hectares	981, 407
5 to 10 hectares	554, 174
10 to 20 hectares	
20 to 50 hectares	

From 50 to 100 hectares	41,623
100 to 200 hectares	11,033
200 to 500 hectares	9,814
500 to 1,000 hectares	3,629
1,000 and upwards	515

The above figures show that of the 5,276,344 agricultural holdings about $17\frac{1}{2}$ per cent. are from 0.0247 to one-half acre, 26 per cent from $\frac{1}{2}$ to $2\frac{1}{2}$ acres, 14 per cent. from $2\frac{1}{2}$ to 5 acres, 18 per cent. from 5 to 12 acres, $17\frac{1}{2}$ per cent. from 12 to 50 acres, $5\frac{1}{2}$ per cent. from 50 to 247 acres, 0.40 per cent. from 247 to 1,235 acres, 0.07 per cent. from 1,235 to 2,420 acres.

The proportion of farm owners to the renters is given as follows:

Size of farms.	Owners.	Renters.
Below to $2\frac{1}{2}$ acres	1,631,336	691,980
$2\frac{1}{2}$ acres to 247 acres	2,157,640	116,456
247 acres to 2,471 acres	638,414	15,527
2,471 acres and upwards	19,817	5,174

These figures show that out of the 5,276,344 agricultural holdings about 15.7 per cent. are rented.

In conclusion it may be said that while the number of emigrants to the United States of America is proportionately large it must not be overlooked that these emigrants are not such a great loss to Germany after all. The value of the exports from Germany to America in latter years amounts annually to an average of about \$60,000,000, a trade which, I venture to say, is almost entirely kept up by the Germans themselves, and consequently it is obvious that Germany, on the other hand, is very materially benefited by their people in America.

WM. D. WAMER,
Consul.

UNITED STATES CONSULATE,
Cologne, June 1, 1886.

CREFELD.

REPORT OF CONSUL POTTER.

In compliance with instructions contained in Department circular dated April 27, 1886, requiring information regarding the "extent and character of the emigration from the consular district of Crefeld," I would report that careful inquiries at the offices of the local authorities and at the various chambers of commerce in this district reveal the fact that no records or statistics are there to be found which exhibit the "extent and character of emigration from this particular district," or which refer to the subject in any way.

Records relating to emigration from the Kingdom of Prussia appear to be kept only at Berlin. The extent of emigration from the entire

It may, however, be stated that the number emigrating from this consular district to America is very small when compared with the number leaving other parts of the Kingdom.

The class emigrating from the Crefeld district for America are mostly expert and reputable artisans connected with some branch of the great textile industry which centers in Crefeld. Persons of this class seldom leave this locality unless induced to do so by the certainty of higher wages in positions previously secured for or offered to them in similar industries.

The causes of limited emigration from this district are to be found in the fact—many times referred to in previous reports from this consulate—that the manufacture of silk goods in this locality is a “house industry,” carried on in thousands of little homes scattered over a broad district of fertile country of which Crefeld is the center or counting-house, from which work for the weavers is distributed and received, and paid for when finished.

The maintenance of the weavers’ “industrial homes” is encouraged and aided by manufacturers as a means of permanently retaining and controlling experienced and reliable employes. Though the earnings of the silk weavers are meager in the extreme, they love their homes and little gardens, and cling to them with a degree of attachment which threatening famine cannot sever. There are in Crefeld and surrounding country between 200,000 and 300,000 of this class of artisans, including the numerous members of their usually large families.

The social and moral condition of the “home workers” is higher than that of the factory hands in the city, and is widely different in many advantageous ways. There seems to be an element in the atmosphere surrounding “a home” that softens and refines the natures of the occupants and lifts them to a higher plane in social existence. They seldom express a desire to leave their homes and fatherland, and they are too poor to command the necessary means to emigrate, even if they desired so to do.

The attitude of the local governments and the manufacturers in this locality is that of opposition to emigration. They would rather, for the reason named, assist this class of artisans to remain where they are.

Deportation of chronic paupers, insane persons, or criminals to the United States from this district is not known to me. Had such events come to my knowledge they would, of course, have been immediately reported to the Department. It can, therefore, in a general way be said that from the Crefeld district no dangerous class of emigrants have gone to the United States during the past five years.

Instances worthy of mention and inviting some reflection are, however, known where expert dyers and Jacquard weavers, who appeared to be contented here with maximum wages of not more than \$4 per week of seventy-two hours’ labor, accepted offers and emigrated to the United States, where they earned from \$15 to \$18 per week of 60 hours, but who there soon became discontented and joined others in a strike for higher wages. It is known that a number of these persons have from choice returned and resumed their former situations at \$4 per week of seventy-two hours, and again appear to be contented.

Strikes are of rare occurrence in this district, and when one does take place it is usually confined to a single manufacturing establishment.

communities that an effective strike in this country is possible, unless one is undertaken with a view to a violent appropriation or destruction of property belonging to classes of wealth. In Germany, whose army is so thoroughly in hand at all points, violence of that character is nearly impossible, and is not thought of or feared in any quarter.

THE GENERAL AND LOCAL GOVERNMENTS AND THE WORKING CLASSES.

After conferring with many intelligent representatives of the working people, the conclusion naturally arrived at is that the comparative degree of contentment which appears to prevail among the artisan classes of this district, and perhaps throughout the Kingdom of Prussia, is due to their intelligence and correct comprehension of prevailing facts. They know that the fortunes of manufacturers are generally small and slowly accumulated. There is not in this locality any sudden accumulations of wealth resulting from manufacturing operations. An interest of 5 or 6 per cent. on invested capital coupled, with the work, responsibility, and care of the manufacturer, will at this date correctly measure the limit of the capitalist's gains. It is known, too, that the extreme of economy and financial prudence is practiced in the management of the general and local governments, and that no great enterprises involving the expenditure of public treasure are undertaken unless in behalf of interests favorably affecting the laboring classes. The imperial and state governments and the local governments in Germany, while working under the disadvantage of overpopulation, appear to be ceaseless in earnest practical efforts to promote the commerce, manufactures, and trade of the country with a view of keeping its people busy. To accomplish such an object seems to be regarded as the very essence of the functions of Government.

The public servants of Prussia, in all departments of Government, seem to realize that a busy people are contented, and that idleness breeds discontent and anarchy.

The recent acquisition by Germany of territory in different parts of the earth was undertaken with the sole view of finding homes and business for her redundant population, and at the same time creating a market for the products of home industries. The emigration of certain classes to these localities under German control is encouraged, and, while no serious restraint is put upon emigration to other countries, it is not, I think, encouraged by the Government.

The burdens of general and local taxation are heavy, but it is well understood that they are as light as it is possible to make them. No one complains of waste or extravagance in public expenditures. The army is enormous in numbers, but it is maintained at a minimum of cost. The pay of its officers is in due proportion to that of the common soldier, who receives but 5 cents per day, and with this sum he is obliged to keep his equipments in a condition of perfect order and neatness, and purchase for himself coffee, shoe-blackening, and the material with which he polishes the buttons and whitens the belt of his uniform. There are hardships connected with this enforced economy, but it is a complaining German soldier, or one who is

might be increased, but the present output is already larger than the market demands. It is, therefore, assumed that the five or six hundred thousand young men now in the army, if liberated, would add nothing as producers to the wealth of the overpopulated country, while the Government can, by healthful training, improve their minds and bodies and give them a wholesale support as soldiers much cheaper than it could be retailed to them at home, where they can neither find room nor productive occupation.

To the suggestion that the men might relieve the peasant women of the masculine work now performed by them, the answer is made, "That would add nothing to the productive wealth of the country, and besides, what would the peasant women with good appetites do?"

Such is the logic of intelligent workingmen with whom I have conversed. They understand the inevitable industrial condition of their country, and adequately measure the relations of the Government to the working classes. The policy of the Government touching import duties and systems of collecting revenue is sometimes questioned, but its purpose to benefit the laboring classes and faithfully serve the public welfare is seldom doubted.

While, therefore, the artisan class here may regard their lot in life as hard to bear, they do not trace the cause of it to rulers and politicians, or to laws and customs, nor to the inhumanity and indifference of society and the communities in which they live. They solve the difficulty with a shrug of the shoulders, and simply say, "There too many of us," and wisely conclude that complaints are useless when there are no visible remedies to apply to them but emigration. For these reasons they resolve to be contented and study methods of extracting from life all the fractions of happiness accessible to them. And the amount of personal enjoyment which a German artisan manages to secure by an ingenious use of his scanty earnings might furnish valuable suggestions to those who are uneasy and discontented until they have attained the rank of "millionaire."

The efforts during the last three or four years of the general and local governments to improve the condition of the laboring classes has had a tendency to check emigration to the United States. Satisfaction with the work of rulers has produced, in a degree, contentment and hope, and it is only the more undesirable classes who are now not unwilling emigrants from their fatherland.

In further replying to the fourth inquiry of the circular, I beg to say, "the general manner of living, as regards housing, eating, and clothing" of the artisan class in this district has been fully described and illustrated in several reports of recent date from this consulate, to which I respectfully refer as follows :

Report on Labor in Europe, 1884; also to Report on Improved Machinery for the Manufacture of Textile Goods, 1885, pages 408 to 410; also to Report on Leather, Boots and Shoes, 1885, and to Report on Agriculture in Germany, 1886.*

The following tables give the latest accessible information regarding "marriages and divorce facts, children, 'natural' and legitimate, religion, emigration, births," &c.

* Born in public institutions, 3.

† Present population about 120,000.

HAMBURG.

REPORT OF CONSUL LANG.

Precise statistical account of the number of emigrants departing from Hamburg to foreign ports has been kept since the year 1826, but no emigration office or bureau, whose duty it was to take in hand and control all matters and subjects relating to emigration, was established until the year 1874. Notwithstanding every effort is made to have all statements relating to emigration as accurate as possible, yet errors and inaccuracies frequently occur, principally traceable to erroneous statements made by the emigrants themselves. The time between their arrival and departure is too short to admit of extended inquiry.

The subjoined tables contain the official reports compiled at the emigration office in Hamburg. From these reports it will be seen that a large number of those who have emigrated by the way of Hamburg have refused to make declaration of their profession or avocation.

From 1879 to 1883 the number reached 33,143 persons, or 23.1 per cent. of the total emigration. It will therefore be impossible to give a correct statement of the emigration as to their callings and professions. Among those refusing to give full and correct information to Government officials are embraced the worst elements, the criminals and refugees from justice. The better and more substantial persons who emigrate make no hesitancy in furnishing full and satisfactory information.

During the year 1884 (to this date Government statistics have been published) there have been conveyed from Hamburg to different foreign ports 91,603 emigrants. Comparing this number with the number conveyed in 1883, there is an increase of 2.39 per cent.

Emigrants conveyed—	1884.	1883.	Increase+; decrease—.
Direct			

CAUSES OF EMIGRATION.

The inclosed statistical tables show that the emigration by way of Hamburg for the year 1884 numbered 49,985 souls of German birth. This is a large number of people, and it is not unnatural to inquire why so many choose to leave their native land. The causes are to be found in the social conditions of the German population. The chief reason which influences so many, and especially those elements which are not impoverished but may be considered the most energetic, to seek their fortunes in new lands, is overpopulation. Another cause can be traced to that old roving spirit of the Germans, which has carried thousands across the seas to improve their fortunes, and has established German habits and customs upon so many distant soils. This class, too, are by no means needy.

While we speak of overpopulation as a cause and principal factor in producing emigration, it must be observed that the most densely populated districts do not furnish the largest number of emigrants. Two things are to be considered, population and the natural resources of the country. The centers of the densest population are also the centers of the most active commerce and industry, where the resources afford a greater multiplicity of employment.

Even in purely agricultural districts, thinly populated, there appears an overpopulation, for the lands are held by comparatively few, and with the exception of the denizens of the cities and towns, the population is employed as day-laborers, small tenants, and help upon lands that do not belong to them and which they never can hope to acquire.

The largest contingent of emigration is drawn from the agricultural class. This is demonstrated in the case of Pomerania, the thinnest populated province of Prussia, yet it furnishes the largest number of emigrants, as is exhibited by inclosed table.

In Pomerania the lands are in the hands of large land-owners. The condition of the tenants and day-laborers are not unlike those of Ireland, where the population diminished during the period of 1845 to 1880 from 8,295,000 to 5,160,000, mainly through emigration.

The decrease by emigration from Pomerania is not so large as that from Ireland, but approaches nearer these figures than any other German province.

Before the year 1885 the two western provinces of Prussia furnished a larger quota of emigrants than the six eastern, but since that period the contingent of emigration from the eastern provinces has been greater than from the western.

The movement of the tides of emigration has been from the west to the east. This no doubt is due to the development of Rhenish and Westphalian industries, which have furnished new employments to thousands of persons who would have emigrated, but have found in their homes the means of earning a livelihood.

The new Prussian territories, Schleswig-Holstein, Hanover, and Hesse-Nassau, put forth a very large emigration for a few years after 1866, and though it has diminished to some extent, it is still large, embracing on an average more than the other provinces.

CHARACTER OF THE EMIGRATION.

Bavaria, an almost entirely agricultural state, shows less emigration than any other state, which is quite certainly due to the fact that the condition of the small farmers is more favorable and their prosperity more pleasing in Bavaria than elsewhere in Germany.

The lands in Bavaria are parceled out in small properties to freeholders; large entails do not exist, and the consequence is that the farmers are content, and unfavorable to leaving their native land with all its endearments.

Of the whole emigration, 21.9 per cent. are from the rural districts. The percentage, though large, can be easily accounted for. Not only the small farmers but also the agricultural day-laborers and servants, as well as agricultural artisans and mechanics, are included in these computations. Those constituting this class are the best fitted and adapted to colonize new countries, but they, more than all others, are urged by a direct wish and an implacable desire to become landowners. They compare their position in the old country to that of their own masters, and go willingly to a country that offers them a hope, through diligence, perseverance, and patient labor, to acquire a home with like comforts of those of their masters. If this be not their sole aim, the higher wages paid agricultural laborers in the United States tempts thousands to try their fortunes in America.

This class of emigrants is the most beneficial to the new countries awaiting development, and it is therefore favorable to the United States that it constitutes such a large proportion of German emigration.

Persons belonging to the scientific professions and to commercial pursuits have not the same inducements to seek homes and employment in new countries as those engaged in agricultural pursuits; the prospects for ready engagement are not so favorable to them. If in their country trade and commerce are depressed, to them there is a hope left that a change may take place and trade and prosperity may be revived. To the tillers of the soil no anticipations of a brighter future can be entertained; the lands are fully developed and occupied, and overburdened with teeming, patient laborers. The only bow of promise to them is in emigrating to more inviting fields. Here is a reason for so large annual outpouring of the German agricultural population.

EMIGRATION IS VOLUNTARY.

The emigration from Germany is voluntary. By a law passed June 1, 1870, all persons who choose to do so can emigrate in times of peace except those who have not yet fulfilled their duty as citizens in respect to military service.

Under the compulsory system of military service every able-bodied male inhabitant of the Empire must serve three years, but under some circumstances this period may be reduced to one year. All those actively engaged in the army and navy and those belonging to the reserve (*Landwehr*), and all persons between the ages of seventeen and twenty-five years who have not produced testimony that they are not emigrating to avoid military service, are forbidden from emigrating by the fifteenth article of the emigration law.

The penalty in-

Persons who are free from military service are permitted to leave the country.

No passport or certificate of citizenship is granted. Ten years' voluntary absence forfeits all rights and privileges of citizenship. The greater part of the emigrants are free of military service, yet there are some who owe military duty and seek to evade it by emigrating.

It would be difficult to ascertain the correct number, as the statistics can only be obtained through the list of military deserters, which is not made public, but it is estimated that the desertions from military service by emigration numbered 10,690, of which 4,503 were agricultural laborers.

The Government neither favors nor restrains emigration; all its ordinances on the subject look only to the welfare and kind treatment which shall be extended to them on their journey. It was indeed a long time before the Government arrived at this wise conclusion. Prohibitive measures were tried and proved void of results. It would be impossible to check the tide of emigration without presenting through the industrial pursuits a more favoring prospect of a coming prosperity.

Another cause promotive of emigration is found in the *Sozialistengesetz* (Socialistic law). This law was enacted by the force of public sentiment aggravated by the two attempts on the life of the venerable Emperor William, and deprives many, on account of their political opinions, of their privileges, and relegates them to the administrative power of the police. Under the provisions of this law a person who is suspected of Socialistic views may be banished from the city where he lives. Also by this law certain cities are placed partially under martial law, viz, Berlin, Hamburg, Leipsic, Chemnitz, and more recently Spremberg.

As other German states pursue a like course the Socialist finds himself forced to seek shelter and home in some other country. The greater number of Socialists who have emigrated have gone directly to the United States. This may be stated as the only way in which the German Government exerts an influence which would encourage emigration, and if it does this, it is indirectly.

Criminals are never banished; on the contrary, they are forbidden to leave the country until they have suffered the penalty which the law inflicts. If they escape, every effort is made to recapture them. Banishment has never been adopted by the German Government as a method of riddance of the mischievous and turbulent elements of society; even penal settlements have ever been repulsive to the ideas of the Imperial Parliament. As the bulk of German emigration goes to the United States, so also the majority of the criminals and refuse of society that leave the country find their way there.

The freedom of our republican form of Government, the liberty of the press, and the right to hold public assemblies have proved to be a congenial encouragement to Socialistic agitators.

An opinion prevails that leading members of the German Socialistic party are going to the United States for the purpose of consolidating and molding into one solid, compact party the German Socialists who have heretofore emigrated there, and who are now acting in a separate and unmolested condition.

the rules, precepts, ideas, and teachings of his party. Socialism is the blossom and anarchy is the fruit from seed sown by Barleau, Lasalle, Marx, and other eminent Social-Democrats. The strict police regulations of the German Government suppress Anarchism by sheer force, but it may be a question pregnant with alarm that two-thirds of the Social-Democrats who have and are emigrating to the United States may not grow step by step under our free institutions more and more radical in their views and demands, thus becoming Anarchists and the disturbers of the peace and order of society.

A deportation of paupers is never practiced by the Government. The emigrants are by no means wealthy, or in many instances not even well-to-do citizens, but are not paupers. They have money enough to pay their passage, and not infrequently a sum to aid them in making a commencement in their new home. Large numbers are induced to go over by friends who have settled in America and have succeeded, and they often assist them by sending a prepaid passage ticket.

The emigrants from the northern districts of Germany, Schleswig-Holstein, Hanover, Mecklenburg, Lubeck, and the Hamburg territory are sober, steady, patient, and industrious people. They live plainly, having no pretensions in regard to the style of their houses or their modes of living and dressing. They expect to find a remuneration for hard labor such as they are accustomed to, better living, and more agreeable conditions of life than they leave. Such persons are rarely disappointed; they are generally contented and become valuable citizens.

Religious proscriptions cannot be stated as a cause of emigration. Nearly all the states of Germany recognize a state church, yet all creeds of religious faith enjoy equal rights and privileges in worshiping. It has ever been a prominent feature in the Hamburg Government to tolerate the largest religious liberty. The recent anti-Semitic movement may have induced a few Israelites to leave the country, but as the prosecution has been confined to a few individuals, it has not and cannot be assigned as a cause producing emigration.

Insane persons are only allowed to emigrate in company with their relatives and guardians. The strictest regulations are observed to prevent the escape of unfortunate lunatics, who under the authorities must be taken care of either in private asylums or in the Government sanitariums, which are model institutions of their kind.

Neither in Hamburg nor in the German Empire is emigration considered as a fit or lawful method of ridding the country of the obnoxious elements of the population.

There is no such thing as assisted emigration by the German Government, but by some foreign Governments, especially some of the South American states, which fully realize the value and importance of the introduction of a laboring population, which with favoring conditions would develop into the best and most useful citizens.

The efforts of these states to turn the channels of emigration from the United States have proven of little or no consequence. The only instances of assisted emigration from Germany are those of some member or members of a family whose course of life would reflect dishonor to the family's name and social standing; to avoid this the relatives or friends ship him or them to the United States of life in

this is not the case these persons become chronic growlers, join the bards of disaffected, and become Anarchists and disturbers of order and social quietude. From my knowledge of the character of German emigrants that have settled in the United States the good largely predominates. Of course where there is much light there must be some shadow.

Among the German element of our population there are to be found many eminent and praiseworthy features that would honor and embellish the citizenship of any country. It is true, there have been some importations whose conduct would naturally array in hostility the sentiment of all good and just people, but we have the consoling reflection that by the force of sound and just administration of public opinion all disturbances produced by such persons will be quickly stamped out and the actors consigned to an ignominious oblivion.

The only method which suggests itself to my mind for limiting and restricting emigration to the United States is to place it under consular inspection at the port of embarkation. Let the vessels understand that they will not be allowed to land emigrants who have not passed the inspection of the consular officer of the port from whence the ship sails and who do not bear his certificate of inspection. This inspection should embrace healthfulness, physical condition to earn a living, ability to support themselves until employment could be obtained, character for honesty and industry and obedience to law, &c.

WM. W. LANG,
Consul.

UNITED STATES CONSULATE,
Hamburg, June 16, 1886.

Destination of emigrants conveyed via Hamburg in the year 1884.

ITALY.

ROME.

REPORT OF CONSUL-GENERAL ALDEN.

In compliance with the instructions contained in the Department circular dated April 27, 1886, I have the honor to report the following facts relating to emigration to the United States from this consular district, and also from the Kingdom of Italy to the United States, from 1876 to 1885, so far as they can be obtained.

No statistics prior to 1876 can be obtained, for the reason that a different system of registry was adopted beginning with that year.

I may here remark that the area covered by the consular district of Rome is roughly estimated to include nine of the sixty-nine provinces making up the Kingdom of Italy; this district may also be roughly estimated to cover 17,398 square miles, having a population of 3,500,000 inhabitants.

Emigrants are divided by Italian statisticians into two kinds, namely, permanent and temporary, the latter consisting of persons who leave
 / / / } for travel or to seek work in

DISTRIBUTION OF EMIGRATION FROM
ITALY IN 1884.

as this district can be defined for statistical purposes to the United States from 1876 to 1885, was as follows:

Year.	Total number of emigrants.	Year.	Total number of emigrants.
1876.....	15	1881.....	324
1877.....	2	1882.....	561
1878.....	30	1883.....	531
1879.....	42	1884.....	178
1880.....	80	1885.....	326

The diminution in 1884 in this district, as well as in other parts of Italy, was owing to the cholera epidemic.

Emigrants according to sex from the consular district of Rome to the United States, from 1876 to 1885.

Years.	Permanent.			Temporary.			Grand total.

The greater number of emigrants from this consular district, as well as from other parts of the Kingdom, is drawn from the rural districts—they being farm laborers, shepherds, and peasants. A considerable proportion of the total number of emigrants to the United States leave the country in the hope of finding work on railway constructions and other public works. Emigrants from the highlands are sometimes small peasant proprietors, but from the lowlands they are generally farm laborers. In this district, as well as in other parts of the Kingdom, emigrants for the United States rarely carry more than from \$10 to \$30 over and above their passage money, and in many instances it has been found that this amount, including passage money, has been raised by loans at the rate of from 50 to 75 per cent. interest; this of course, is all to be paid from the prospective earnings in America.

In 1882 the Government issued a circular inviting the prefects of the Kingdom to furnish accurate information as to the causes of emigration from their respective provinces and its effect on the economical condition of the country.

Categorical answers to the following questions were requested:

- (1) Are people driven from the country by destitution alone, or are they influenced by speculators interested in marine transportation, or by the paid agents of foreign Governments or emigration companies?
- (2) Is it true that in many instances entire families of small peasant land-owners sell all their possessions to enable them to emigrate?
- (3) What positive and practical effect has this emigration produced on wages, on the money value of land, and in general on the agricultural economy of the communes or provinces during the last ten years?
- (4) What changes in the direction of emigration have taken place during the decade?
- (5) To what classes of society do emigrants from the several districts belong? Are they land-owners, farmers, or laborers who emigrate for want of employment?

The answers of the prefects were nearly unanimous in ascribing emigration to three causes, namely, destitution, lack of work, and a natural desire to improve their condition.

It appeared that during recent years there have been various illicit means used for inducing persons to emigrate, such as flattering advertisements, letters, offers, in the interest of persons or swindling companies, of from \$4 to \$6 per emigrant to persons who can influence emigration. Changes in the direction of emigration have been slight.

It was found that nearly nine-tenths of emigrants to all countries were drawn from the agricultural classes.

Cases of land-owners who sell their possessions to enable them to emigrate were found to be comparatively rare, and it was found that emigration had not produced any appreciable effect on wages, or on the money value of land, neither on the economy of the country in general.

Compulsory military service, onerous taxation, and strikes have had practically no influence on emigration to the United States.

WAGES AND COST OF LIVING.

As to the wages of agricultural laborers, from whom the chief number of emigrants to the United States from this district and from Italy are drawn, I may say that near Rome and other large towns they receive from 20 to 60 cents per day, not including board and lodging, and in some districts artisans are paid from

The lowest cost of living to the laboring classes in the city of Rome and its environs would be as follows:

Breakfast.—A loaf of coarse wheat bread, unsalted, weighing 12 ounces, 2 cents; fruit in summer and cured cheese in winter, 1 cent; total, 3 cents.

Dinner (at noon-day).—One-half loaf of bread as above, 1 cent; a stew made from scraps of tripe, lungs, and the like, or soup prepared with garlies or onions, pork fat, or lard thickened with garlies, olive-oil, or grease, 3 cents; total, 4 cents.

Supper.—Same as breakfast, or varied with salad and bread; total, 3 cents.

Lodging.—Single person, at 60 cents per month; per day, 2 cents.

Grand total of cost of living and lodging per day, 12 cents.

Clothing is a small item of expense, and laborers earning small amounts will always undertake odd jobs to procure extras or an occasional glass of wine.

MORALS.

The civil marriage is the only marriage recognized by Italian law. The Pope alone can dissolve the bonds of matrimony, but rarely exercises this power.

In recent years, on an average, out of the total number of children born in the Kingdom, 92½ per cent. have been legitimate and 7½ per cent. illegitimate.

I am satisfied that there is no emigration to the United States of chronic paupers or insane persons, either from this district or other portions of the Kingdom, and also no assisted emigration.

The Government does nothing to prohibit or restrict emigration. Its attitude is simply that of watchfulness to prevent the swindling or deceiving of ignorant persons.

No special rates of fare are offered by any company or companies in this district. The fare usually paid by third-class passengers from Italian ports to New York is the regular steamer rate of about \$30 for each person.

In the case of emigration to the United States, the large number of Italians who have there found what is for them lucrative employment has greatly influenced the current of emigration in that direction during the past few years. The steamers of the Italian General Navigation Company, known as the "Florio-Rubattino" steamers, now plying direct between Italian ports and New York, have also influenced considerably in increasing the number of emigrants, especially from the southern portion of the Kingdom.

A proof of this may be found in the increased number of emigrants to the United States directly following the establishment of this line in 1879.

Emigration to the United States from this consular district is chiefly through the port of Naples; for other portions of the Kingdom it is through the ports of Naples, Palermo, and Genoa. A comparatively small number embark from France at the ports of Marseilles, Bordeaux, and Havre, and a few from the ports of Germany and England.

As to the habits and morals of the emigrants to the United States from the northern and central portions of Italy, both men and women are sober and industrious, and as a rule trustworthy.

prevalent. The men are frequently hot-tempered and quarrels often end in bloodshed. They are, however, seldom addicted to drunkenness, and the women are regarded as chaste. In spite of the prevalent opinion that the Southern Italian laboring classes are lazy, they are, like the rest of the Italians, a hard-working and industrious people, and endure hardship and adversity with great patience.

WILLIAM L. ALDEN,
Consul-General.

UNITED STATES CONSULATE,
Rome, Italy, August 2, 1886.

MILAN.

REPORT OF CONSUL CROUCH.

The following statistics are taken from the reports of the department of agriculture, industry, and commerce, which assumed charge of this branch in 1876. The statistics previous to this time are practically without worth. Even those given below are defective and not entirely reliable, for the sources of error, especially in Northern Italy, are very great, as a brief description of the methods employed will show.

The mayors of the various communes into which the provinces are subdivided, report each year the number of emigrants from their communes, the character, whether the emigration is temporary or permanent, the trade or occupation of the emigrants, and other facts of like nature. For their information they rely mainly upon the register of the passports, with which each emigrant is expected to provide himself before his departure, and this information they supplement by any facts which may come under their personal observation or be reported to them from unofficial sources. Such a system may be sufficiently exact when the emigration is from sea-ports, but in the facility with which the inhabitants of Lombardy, in the search for employment, pass over the borders into Austria, and especially Switzerland, and from there, or through Piedmont, into France, is at once apparently a very fertile source of error. Moreover, emigrants passing into these countries in search of temporary employment are very often induced to emigrate to America. The result of such indirect emigration is seen in the comparison of the statistics of Italy and the United States for the same period:

Total emigration to the United States from Italy.

Source of information.	1876.	1877.	1878.	1879.	1880.	1881.	1882.	1883.
Italian statistics.....	1,441	976	1,993	3,208	5,756	11,868	18,669	21,337
United States statistics	2,981	3,666	5,392	9,043	12,782	20,107	29,437	29,537

It is evident from this comparison that only the statistics of recent years can be accepted as of any value.

In the statistics for Lombardy previous to the year 1880, emigrants to the United States and the adjoining countries, and to the South

to the United States, with the percentage which the number to the United States bears to the whole number. This might afford some information, if the comparison made above did not demonstrate the unreliability of the Italian statistics for those years.

Years.	Lombardy to America.	Italy to America.	Italy to United States.	Per cent. to the United States.
1876.....	7,391	19,610	1,441	7.4
1877.....	3,318	21,169	976	4.6
1878.....	2,746	20,743	1,993	9.6
1879.....	4,478	37,075	3,208	8.9
1880.....	3,850	33,080	5,756	17.4

Commencing with 1880 the number of persons leaving Lombardy for the United States, according to Italian statistics, is as follows:

1880.....	173
1881.....	536
1882.....	912
1883.....	778
1884.....	*240
1885.....	355

CLASSES TO WHICH THE EMIGRANTS BELONG.

In general, the largest contingent of emigrants is supplied by the agricultural classes. Among these it is the class of small tenants and the small proprietors, when the products of their bits of land have become absolutely insufficient to support their families, that emigrate to America, more especially, however, to South America. The day-laborer is usually unable to emigrate for lack of means. And, in general, the attachment of these poor people to their homes is so great that they endure the utmost privations rather than leave them, and when persuaded or driven to emigration, it is usually with the intention of returning.

In addition to the agricultural classes which supply the largest number of permanent emigrants, is especially noticeable the class of stone masons. The records of the booking agents in Milan show that the majority of emigrants to the United States so far this year (1886) belong to this latter class. They go to America in the spring months, and being excellent workmen find employment readily at good wages, and are able to return with their earnings, as a majority of them do, and spend the winter comfortably at their homes. The following spring very frequently finds them on their way back to America.

The remainder of the emigrants consist of domestics, waiters, and operatives of the various trades.

CAUSES OF EMIGRATION.

The general causes of emigration are, in a word, overpopulation and high taxes. As to compulsory military service, it is claimed that the desire to avoid it is not a strong factor. It is, however, by no means without effect in this direction, and the desire of the father to see his sons freed from the

The first impulse to emigration is the discontent among the lower classes with their own condition, which is steadily becoming worse. The cost of living has increased immensely in the last few years, with the great increase in taxes. Rents are higher, while the value of the produce of the land is kept down by foreign competition. The large development of industrial interests in certain portions of Lombardy has not sufficed to remedy these evils, and the final resource is emigration. This takes especially the form of temporary emigration, one or more members of the family passing into the neighboring countries where employment is to be had at better wages. The discontent among these people is further increased by the growing knowledge of the vastly better economic conditions in the countries of the New World, by the example of emigrants returning with comparative wealth, by reports and money sent from friends and relatives who have thus sought and found fortunes, and also by the glowing and exaggerated descriptions of the agents of steamship lines, land companies, and similar interested parties.

The immediate cause is usually the failure, more or less complete, of the crops for the year, and the consequent inability to pay the rent and the heavy taxes. It is noticeable, in this connection, that these people usually emigrate in the autumn months, when the contracts terminate.

Among the operatives the emigration is determined by the want of occupation at home.

In addition to these causes of general application, there are others of a local nature, varying with the different topographical and economical conditions of the different provinces. The northern part of Lombardy is mountainous, sparsely settled, and less fertile. The inhabitants, for the most part, are engaged in agriculture, and belong to the class of small proprietors. Other interests of some importance are quarrying, and, to a small extent, mining. The most important agricultural product is wine. There is a large temporary emigration to France, Switzerland, and other neighboring countries, where the artisans and the surplus of agricultural laborers find employment. The permanent emigration was until 1881 very small, but two or three seasons of inclement weather and the ravages of the peronospora made a perceptible difference. Thus, for instance, from the province of Sondrio, with a population of 120,534, the number of permanent emigrants for the years 1880, 1881, 1882, and 1883 was, respectively, 169, 252, 324, and 810.

The intermediate zone, consisting of hilly country and the land sloping to the lakes, enjoys a favorable climate, is very fertile, producing wine, fruit, and silk cocoons in abundance, and has large industrial interests, especially in the various branches of silk manufacture. Emigration is influenced by the causes which affect the crops, such as the diseases of the vine, which in the past years has done great damage; further by the greater or less demand, and consequently higher or lower prices, for raw silk, the main article of export, and by the greater or less prosperity of the manufacturers.

The southern portion of Lombardy consists of low, level land in the valley of the Po, is of the greatest natural fertility, immensely increased by the perfect system of irrigation in use, and sustaining a population which, for a strictly agricultural district, is probably the most dense in

pensated by the growth of other industries, and a continuous and increased emigration may be expected in the future.

SOCIOLOGY.

In Lombardy the most numerous and important class are those engaged in agricultural pursuits. Among these may be distinguished: (1) Land-owners, very largely peasant proprietors; (2) metayers, who hire the land on certain peculiar conditions, paying half the taxes and turning over to the owner half the products; other proportions than the half are also in use; (3) tenants paying a fixed rent, including also a relatively small number enjoying hereditary privileges in this respect on certain estates; (4) the agricultural laborers.

The relative proportion of the first three classes is in the order in which they are named. The fourth class is more numerous than the other three combined. The proprietors, metayers, and tenants all possess a certain capital, however small. The agricultural laborer is entirely dependent on the small wages he receives.

Next in numerical importance are the operatives in the various branches of manufacturing, especially in the silk industries. The silk, cotton, and woolen factories employ largely female labor, the proportion being over four females to one male. The competition of labor in these districts maintains low wages, but on the whole this class is relatively in better condition than the agriculturists.

The food of the working classes consists mainly of *polenta* (boiled Indian meal) and bread of inferior quality, with rice-soup, and among the better classes, macaroni, with greens, cooked with butter, cheese, lard, or milk. Among the poorer agricultural classes, especially in years of bad harvests, the food is almost exclusively polenta, frequently made of diseased and inferior Indian corn. In this connection it is interesting to note that the peculiar disease, pellagra, which is only known to exist in certain portions of Southern Europe, and which the scientists are agreed to consider a chronic poisoning by a substance generated in diseased corn, affects a greater proportion of the population, viz, in 1879, 31.7 per thousand, than in any other section of Italy.

The clothing is made of the inferior grades of mixed cotton and woolen goods, which are to be had very cheap here, and underclothing of cotton.

During the winter, which is more severe in Lombardy and Piedmont than in any other part of Italy, the poorer classes suffer much from exposure. Fuel is very expensive, for wood is scarce, and the coal used, being imported, and subject accordingly to the expense of transportation and customs duties, is also very dear. The poorer classes accordingly go without fires, and it is customary even among classes of a much higher grade socially, either to dispense with fire entirely, or to confine its use to the narrowest possible limit, and to live in imperfectly heated rooms. This is but one example of the economies to which these latter classes—that is to say, the smaller Government officials, the employés in banks, mercantile establishments and similar institutions, in fact, that class who receive a small fixed salary within limits of which they must live—are compelled to resort to keep up appearances.

The dwellings of the poorer classes vary somewhat in accordance with the partition

classes, in regard to their dwellings as well as their persons, is decidedly low.

The morals of the peasantry are better than might be expected from their manner of life, and will compare favorably with that of any similar class in Europe. The great majority are married, and the marriages are at a comparatively early age. The number of illegitimate children is not large. As is usually the case, the morality of the rural districts is decidedly superior to that of the cities, the residence of the so-called better classes. Indeed, these latter seem to have a freer and broader conception of the marital relation than prevails in the United States, as divorce statistics would undoubtedly show, if divorce were permitted here by the state and by the church. As it is, only legal separations are allowed. Statistics of Milan show that this was asked for from the courts in 1882, 1883, and 1884, respectively, by 240, 231, and 241 persons. The results in 1884, for instance, were: 22 conciliations, 79 separations by mutual agreement and consent, 98 separations in which the conditions were determined by the court, 27 cases abandoned, and 15 cases still pending at the end of the year.

The number of marriages in the same year, 1884, were 2,774, in a population of 349,597, or 1 to every 122.30 inhabitants. Statistics of births show a total for the year of 11,496, of which 1,200 were illegitimate, or 10.18 per cent., which is about the percentage of the two preceding years. This is a low percentage in comparison with Lyons, Bordeaux, Brussels, Paris, with 24 per cent. to 28 per cent., to say nothing of Munich, Vienna, and St. Petersburg, where nearly 50 per cent. of the births are illegitimate.

EDUCATION.

A large share of the rural population is still in a state of almost absolute ignorance. A belief in witchcraft and the baneful influence of the "evil eye" still lingers, especially in the out-of-the-way districts. In this latter regard, however, the peasant population of Lombardy has made great advances, and in comparison with other portions of Italy is in a state of enlightenment. Education is making rapid strides, and the school system, inefficient and faulty as it is, is gradually making way against the obstacles and opposition it encounters.

The following figures, which I have computed from data furnished by the census of 1881, will give an idea of the condition of education in Lombardy as compared with other sections of Italy. The percentage of the population above the age of ten years unable to read and write was at the time mentioned 36.3 per cent. High as this figure is, Piedmont is the only other division of Italy with an equally low figure. The average per cent. of the population of the whole Kingdom of Italy above the age of ten, unable to read or write, was 61.2 per cent., and in the provinces of the former Kingdom of Naples, which included the greater part of Southern Italy, it was 78.9 per cent. These few figures show that Lombardy is much further advanced than the remainder of the Kingdom, with the single exception of the neighboring province of Piedmont. To show the present condition of education in North and South Italy, and what may be expected from the generation now arriv-

other Italians in energy and perseverance. Drunkenness is an exceptional occurrence, for the general use of the native wine, which is plentiful and cheap, seems to exclude the desire for distilled liquors. The prudence of the people is also evident, from the fact that, in spite of the exceedingly low reward of labor, they succeed in good years in laying up a little money. Thus the amount of money deposited in the savings-banks exceeds that of almost every other section of Italy. The prevailing religion is that of the Catholic Church.

The Lombards are comparatively free from hereditary disease. The proportion of deaths from consumption is about the same as that of the United States. Syphilitic diseases occur in about the same frequency as in the middle European states, in contrast to Southern Italy, where the proportion is much higher. Of other diseases not hereditary, reference has been made to pellagra, dependent upon an exclusive use of diseased corn. Two other diseases, or rather two manifestations of the same disease, which, like pellagra, occur in greater frequency than in the remainder of Italy, and in a very high proportion as compared with other countries, are struma, or goître, and cretinism, a form of idiocy. Certain districts of the province of Sondrio, in Lombardy, give a proportion probably as high as is found anywhere in the world. It will be remembered that this disease is held to be dependent on the geological formation and the condition of the soil and water, and that the children of emigrants from the affected localities remain free from the disease.

In considering the Lombards as emigrants to the United States, with regard to the question of assimilation, a word as to their race and the climate of their country may not be out of place. It is to be remembered that the inhabitants of Lombardy and Piedmont are a mixed race, of Gallic stock, with an admixture of blood of the Italian tribes, and also a considerable admixture of Germanic blood. These Gallic or Celtic tribes, descending upon Northern Italy about the sixth century B. C., conquered and expelled the original inhabitants, offered a stubborn resistance to the expanding power of Rome, and formed under the emperors the bulwark of the Roman power. At the beginning of the Germanic invasions they were conquered, and their country taken possession of by Longobardians, or Lombards, a German tribe, who mixed with and were gradually absorbed by the superior number of their subject people. The events of the following centuries brought also a certain proportion of Germanic blood. From these facts it is apparent that they stand much nearer to the Americans, a Germanic people with a very considerable admixture of Celtic blood, than the other inhabitants of Southern Europe, and hence are more likely to be assimilated easily and to have no deteriorating influence upon the race.

The climate of Lombardy and Piedmont differs decidedly from that of the remainder of the peninsula. Shut out from the sea and inclosed by the Alps and the Apennines, Northern Italy possesses a so-called continental climate, not unlike that of portions of the United States. The summers are hot and dry, the winters cold. The average temperature in Milan is: Spring, 59.38° ; summer 71.42° ; autumn, 47.82° ; winter, 37° . More attention might be given to the climate to which emigrants are accustomed in directing the stream of immigration. A large number of the immigrants land at Castle Garden with no fixed objective point, but follow the advice they receive from the officials there.

DEPORTATION OF [CHRONIC] PAUPERS OR [CHRONIC] INSANE PERSONS—"ASSISTED" EMIGRATION.

I have not been able, even through careful and cautious inquiry, to learn of the deportation of any chronic paupers, or insane persons, or of any "assisted" emigration, except where the assistance has come from relatives already in America. It is common enough for the head of the family to emigrate alone, and, as soon as he has established himself, to have his family follow. Laborers, too poor to emigrate, often receive help from their relatives in America, in which case occupation is frequently provided for them beforehand. These belong for the most part to the class of agricultural laborers, dependent entirely upon their daily wages.

I have called attention above to the unusual prevalence of cretinism in certain sections of Lombardy. In this respect they bear a strong resemblance to certain Swiss cantons, from which the attempted deportation of cretins is notorious. It might be well to bear this fact in mind where emigrants land from this part of Italy.

ATTITUDE OF THE GOVERNMENT.

The attitude of the Government towards emigration is nominally indifferent. Emigrants are expected to provide themselves with passports, which entails a slight expense. Even this is avoided easily by emigrants from Lombardy, who leave by the St. Gothard, passing into Switzerland, and thence to the United States, inasmuch as no passports are required in the former country. On the whole, however, it must be said that emigration is not looked upon with favorable eye by the Government. Nevertheless, in certain districts the overpopulation is so evident, that the desirability of emigration is unwillingly admitted. Where emigration takes place the influence of the Government is used to dissuade the emigrants from going to the United States, and to turn them towards South America. The excuse is that in the United States the Italians disappear in the great mass, and are completely lost to their country, whereas in South America, where they form a considerable part of the population, the national sentiment is preserved, and the commerce with Italy extended.

PRIVILEGES OFFERED BY GOVERNMENTS.

As has been frequently said, the bulk of the emigration is towards the South American states. The inducements and conditions are as follows:

For Brazil: A considerable reduction of fare is offered intending colonists. They are received at Rio Janeiro, and lodged free of expense until their departure for their destination, to which they are conveyed gratis. To each is assigned a lot containing 30 hectares, or 74.13 acres, for which they pay 91 cents to \$3.67 per acre. Payment is made either on taking the land or in installments, commencing not later than the

acre. Payment is to be made in fifths at the end of each year, with complete title at the fifth payment.

In Uruguay and Chili the conditions are substantially the same. Chili offers actual settlers a reduction of fare, and loans them farming utensils and beasts of burden.

Thus the conditions, on the whole, are inferior to those offered by the United States. Inasmuch, however, as agents of steamship companies and of these governments have diffused a knowledge of these conditions, which to the Italian seem very favorable, while the conditions offered by the United States with regard to land have remained unknown, the effect on emigration must have been favorable to the former countries and unfavorable to the latter. In addition, there is the greater affinity of race and language in the former countries, and the certainty of meeting compatriots, and the favorable reports sent home by the latter.

CONCLUSION.

During the years preceding the final liberation of Italy from Austrian dominion a large number of persons were obliged to leave their homes for political reasons. A considerable portion sought refuge in the United States, where many made their permanent homes. These belonged, of course, to the very best classes of the land. At present, however, the emigration is confined almost entirely to the peasantry.

The emigration to the United States has not been large, but in late years it has shown a tendency to increase. The competition between the steamship companies has brought about an increased exertion on the part of the transatlantic companies, especially the lines from Havre and Antwerp, to secure passengers, and they are spreading a knowledge of the conditions offered by the United States with some effect. Free land is a great inducement, and together with the greater accessibility of the United States, and the lower fare, is beginning to turn the emigration more in that direction.

Another reason to expect an increased emigration lies in the fact of overpopulation. This, as I have explained, has led to a large temporary emigration, especially into France. But the competition of these people who work for lower wages has given rise to a feeling of hatred towards them on the part of the French laborer, and to constant conflicts and ill treatment. It is not improbable that sooner or later the French Government will be obliged to protect its laborers against Italian competition. When this occurs, and these people are deprived of the resource of temporary emigration, a large increase in the permanent emigration will be the result, and the United States will undoubtedly share in the increase.

HENRY C. CROUCH,
Consul.

UNITED STATES CONSULATE,
Milan, October 4, 1886.

THE NETHERLANDS.

AMSTERDAM.

REPORTS OF CONSUL ECKSTEIN.

I.—EMIGRATION FROM HOLLAND TO THE UNITED STATES.

Prior to the year 1881 there does not appear to have been any control held or record kept from which the number of Netherlanders from this consular district or from this country who have emigrated to the United States could be ascertained and reported.

I am, however, in position to furnish statements showing the number of emigrants of all nationalities who have taken ship in Dutch ports from 1873 to 1885, each year, and their destination, as follows:

Number of emigrants.

Years.	Men.	Women.	Children.	Total.
1873	1,123	818	1,926	3,867
1874	316	226	500	1,042
1875	1,175	556	399	2,130
1876	1,220	693	489	2,402
1877	1,190	696	517	2,403
1878	1,436	779	568	2,783
1879	2,347	1,186	1,131	4,664
1880	5,904	3,166	2,805	11,875
1881	13,805	7,379	7,926	29,110
1882	17,441	8,240	8,640	34,321
1883	10,089	4,380	5,174	19,643
1884*	2,501	1,130	981	4,612
1885*	1,642	645	555	2,842

* The figures covering the years 1884 and 1885 in the above statement represent only the number of emigrants which took ship at Amsterdam during those years.

Destination of emigrants.

Years.	United States.	South America.	Australia.	Africa.	Total inclusive of other countries.
1875	2,091	13	17	9	2,130
1876	2,344	13	21	24	2,402
1877	2,252	31	53	46	2,403
1878	2,671	21	67	24	2,783
1879	4,529	25	83	27	4,664
1880	11,695	34	115	31	11,875
1881	28,782	77	93	158	29,110
1882	34,157	31	74	59	34,321
1883	19,354	81	15	59	19,643

In 1881 a Government board for superintending the passage and carriage of emigrants entered upon its duties at Amsterdam and Rotterdam. Communication was es-

Amsterdam and Rotterdam, and thus benefit the local steamship companies and otherwise foster the interests of those places.

The chief officer of the board at Amsterdam, one D. Van Ketwich, is personally well known to me, and known to me as a most efficient and conscientious person.

Since then a very good control has been and is held, and statistics of emigration are kept and constantly improved.

To Mr. Ketwich I am indebted for the information contained in the following statements; the figures in them are extracted from the books in his office.

Tabular statement exhibiting the number of Netherlands who emigrated from Amsterdam to New York or to the United States during the last five years.

Years.	Men.	Women.	Children, one to ten years.	Infants.	Total.
1881	1,749	1,090	1,089	275	4,203
1882	1,954	1,165	1,264	302	4,685
1883	1,089	735	688	197	1,709
1884	556	353	330	94	1,333
1885	372	215	168	31	786

The number of emigrants as given in the foregoing table were not all from this consular district, but from that of Rotterdam as well, and on the other hand it is most likely that about a similar number belonging and coming from this district depart from Rotterdam for the United States.

The great falling off in the number of emigrants from this country to ours during the last three years forms a noteworthy feature as relating to the matter in hand, and I endeavor to give in this place the best explanation for it that I can.

I feel justified to say, in the first place, that it has not been owing to favorable surroundings or prosperous conditions prevailing in Holland during that period of time, but that, on the contrary, nearly all material interests were, and particularly in 1884 and 1885, in an exceptionally unsatisfactory state in this country.

What, then, caused the decline in emigration?

I answer, that to me it seems to have been caused, in part, because that many parties anxious to come to our shores lacked the required means for accomplishing that object.

The facts that less favorable accounts were received here during those years respecting the general state of material affairs in the United States, and that less substantial assistance reached here from relatives on our side to enable parties to come on, had also much to do with the decline in emigration from this country.

Again, the labor difficulties which induced our Government to adopt certain measures restricting indiscriminate emigration have not only had the effect of keeping really objectionable persons from coming to the United States, as certainly is desirable, but they have also had the effect of preventing quite a number of unobjectionable, perhaps desirable, persons to seek homes amongst us.

I base this statement upon the fact of having been applied to for information a number of times by intending emigrants, against whom there could have existed

This matter may deserve the special attention and consideration of our Government, as what I am saying about it may apply to other countries as well as to Holland.

My attention has also been called to the further fact of the great depreciation in the price of land suitable for farming and dairy purposes during the past few years, which presumably led to purchases in many cases by parties who under ordinary or other circumstances would have emigrated to the United States.

CLASSES WHICH SUPPLY THE GREATEST NUMBER OF EMIGRANTS.

The superintendent of emigration has kept a classified record showing, so far as practicable, the vocation of the emigrants who left this port for the United States in 1884 and 1885.

The record covers emigrants of all nationalities, and a correct copy of it is as follows:

Emigrants who left Amsterdam for the United States.

Vocations.	1884.	1885.
Farmers	313	490
Laborers, country and town.....	1,506	688
Merchants, clerks, book-keepers, &c.....	92	160
Artisans and mechanics.....	293	336
Men*	313	28
Women*	1,114	585
Children up to ten years of age	735	443
Infants	246	112
Total	4,612	2,842

* The numbers of men and women as put down in the above statement without any trade or occupation are explained to me to have consisted of old men and women in some cases, more generally, however, of boys and young men who had not yet chosen any calling, and as to women they are said to represent housewives who, together with their unmarried daughters, had the care of the families.

I am assured by the superintendent of emigration here, than whom no one has more accurate knowledge on the subject, that the agricultural class furnishes the principal contingent of the emigrants from Holland.

CAUSES OF EMIGRATION.

The Netherlanders are anything but a migratory or roving sort of people. They hold in high honor everything historical and traditional relating to and which sheds any luster or reflects any credit upon the nation, and of which there is a great deal, as is universally acknowledged, and they, furthermore, are most sincerely attached to the existing and principal national institutions.

It can well be imagined that under such circumstances emigration from the country is but rarely undertaken for insufficient or trivial cause or causes, but is more generally only resorted to when fair prospects exist that those about to give up their homes permanently to settle themselves in the United States, or in any other foreign country, will by so doing greatly improve their chances for bettering their condition with them, as well as

to the United States, what there has been of it and is, consisted and consists hereof: "That under any wise normal conditions prevailing in our country, when commerce and trade, manufacture and agriculture are flourishing, or only fairly prosperous, the chances there for the newcomers, especially if intelligent and industrious, are generally considered to be, and in my opinion really are, far superior to what they are or would be in Holland at any time to earn a competency or accumulate wealth."

Thus it is that emigration is ordinarily more influenced and increases or decreases according as favorable or unfavorable news respecting the economical and social conditions of the United States is received and circulated here, than it is affected by the local or homestate of affairs.

To a certain but only very limited extent other causes underlie the emigration from this country, but it can be said that neither military service, taxation, strikes, or even surplus population bring about much of it.

MILITARY SERVICE.

It would seem to show how little real compulsion there is or can be in compulsory military service in Holland, when, in this place, I give a translated extract from a war department circular, issued in February, 1873, containing certain instructions to the military authorities, which are still in force and carried out, and wherein the minister says as follows:

With regard to soldiers on furlough who may desire to emigrate with their families to North America, and who, if they were obliged to remain behind, might lose their means of subsistence, it appears to me desirable to deviate from the course hitherto pursued. I am the more induced to do this because, in my opinion, such a measure cannot be deemed to militate against the interests of the service. Besides, experience teaches that those soldiers who find themselves in such a situation generally leave the country without leave. The consideration that they would consequently be regarded as deserters would seldom deter them, as they would go without any intention to return to their fatherland. A great number owing military duty, now marked on the books as deserters, belong to this category.

I have, therefore, resolved for the future not to refuse to soldiers on furlough, who are not called for active service, and may be at any time situated as above stated, the permission to emigrate to North America; with this proviso, however, that use shall be made of such permission, in each case, within one month of the date of its having been granted, after which period it shall be considered as lapsed. Nor shall such soldiers, before their departures, be exempted thereby from any obligations or duties towards the army.

The law of Holland of August 19, 1861, which relates to the organization of the army and regulates the military service is, it seems to me, altogether very liberal. Here follow a few translated extracts from it:

The strength of the army is not to exceed the number of 55,000 men.

The army is to be organized, so far as possible, through the enlistment of volunteers. In default of sufficient volunteers for the army the same is to be completed by conscription of the inhabitants who have entered upon their twentieth year.

There is to be a yearly levy which is not to exceed the number of 11,000 men.

It is optional with every one either to render service personally or to furnish a substitute.

The term of the service is five years.

Mustered-in men are to be kept under arms for military exercise and duty during the whole of the first year of their term of service, if found necessary.

In ordinary times the army assembles once annually to receive instructions in the manual of arms and to be inspected during a period not to exceed six weeks, unless it be deemed advisable to dispense entirely or partially with it.

Neither conscripts nor

TAXATION.

Concerning the matter of taxation in Holland I shall also furnish a few figures, leaving the reader to infer from them whether it is or ought to be considered onerous or otherwise as compared with what taxation is in other European countries and in the United States.

According to a statement published last year by the Association for Statistics in the Netherlands, the product of the principal taxes per head of the population was at different periods, from 1850 to 1884, both inclusive, each year as follows, viz :

Year.	Florins per head.	Year.	Florins per head.
1850.....	18f., 50c.	1870.....	20f. 32c.
1855.....	18 72	1875.....	23 94
1860.....	18 08	1880.....	25 29
1865.....	18 29	1884.....	24 41

The foregoing statement comprises direct taxes, such as ground tax, personal tax, and licenses, import duties, excise duties on the articles of sugar, wine, spirits, salt, soap, beer, &c., and certain indirect taxes, such as stamps, registration, and succession duties, &c.

In a series of very ably written lengthy articles from the pen of a gentleman at Leyden, said to be an eminent authority, published in the principal paper of this city, and upon the subject of, "What the workman of the Netherlands pays in taxes," a result is arrived at which the author states as follows, viz :

If we sum up what is said herein and in formerly published articles, then is shown, calculated for Leeuwarden, what proportion of the taxes are borne and paid by workmen.

It must not be overlooked that the computation has been made upon low estimates, and in more than one respect too low, as for instance import duties are taken note of only on the articles of tea and petroleum, whereas other dutiable articles are consumed by the working classes of the population.

Workmen earning from 5 to 7 florins per week pay excise duty, 11.23 florins per annum; import duty, 2.67½ florins per annum, and personal tax, 3.28½ florins; total, 17.19 florins, being 5½ per cent. on their income.

Workmen earning from 8 to 10 florins per week pay excise duty, 11.23 florins per annum; import duty, 2.67½ florins per annum; personal tax, 6.84½ florins, and capitation tax, 5 florins; total, 25.75 florins, being 5½ per cent. on their income.

Workmen earning from 11 to 13 florins per week pay excise duty, 11.23 florins per annum; import duty, 2.67½ florins per annum; personal tax, 14.96 florins, and capitation tax, 8 florins; total, 36.86½ florins, being 6 per cent. on their income.

Such is the result at which we have arrived—5 or 6 per cent. on their income the workingmen pay in taxes.

Few if any words are necessary to disapprove hereof; the figures speak for themselves. We ought to let these dumb and yet eloquent witnesses arouse us to the necessity of removing this burden from the shoulders of the working people.

There are those who are better able to pay than the workingmen in these times. If we cannot make them richer, let us cease to impoverish them.

STRIKES.

It is remarked that

The condition of most of the industrial interests of this country during the last two years, 1884 and 1885, has been such as to cause the workmen more generally "to strike for work," as it were, than to strike in order to compel an increase or prevent a reduction of wages, for shorter working hours or for anything else.

The unfavorable and unsatisfactory situation in which the working and laboring classes have been placed, their consequent discontent, and such troubles and slight disturbances as have taken place, have all been caused more particularly on account of "great scantity of work" than by anything else.

I remember no strikes being reported in 1885. During the present year, 1886, I have heard of only two; one at Enschedé and another at Maastricht.

Regarding the former, I quote from a letter to me received on the subject from Messrs. van Heek & Co., mill-owners at Enschedé, who say:

We beg to say that the only strike that occurred in our town and neighborhood in the textile manufacturing trade, during a great many years, has just taken place in a weaving shed in this town; commencing on the 1st of April and ending, after four weeks' duration, on the 28th of that month.

About 200 of the weavers out of a total of 250 struck for a re-establishment of their former rate of wages, which, in consequence of the indifferent state of the cotton trade, had been reduced by about 10 per cent. in February last.

The men returned to work without accomplishing their object. Those who were identified with being most active in bringing on the strike were not taken back.

Respecting the other strike, which took place in the glass and earthenware works of Tetrus, Regout & Co., at Maastricht, the firm wrote to me as follows:

The strike was of no importance. Of the number of 2,800 people we employ, only 180 struck during four days, with the result that about 20 went abroad, and when the others came back to work we admitted them, with the exception of about 30 of them, whom we would not have back.

It is not the impression of those here well able to judge that Holland has any considerable surplus population, or is overpopulated.

However, to afford an opportunity to the reader of this report, or to the student of social statistics or political economy, for purposes of comparison with other countries in Europe and the United States, I add hereto several tabular statements showing the area of this country, its population, and the density of the same.

The following statement shows the area of each province and of the whole of the Netherlands, according to the census of 1879, in hectares:

Provinces.	Hectares.	Provinces.	Hectares.
North Brabant.....	512, 832	Overijssel	334, 515
Gelderland.....	508, 097	Groningen.....	229, 761
South Holland.....	302, 163	Drenthe.....	266, 268
North Holland.....	276, 977	Limburg	220, 426
Zeeland.....	178, 506		
Utrecht.....	138, 402	Total area Netherlands.....	3, 299, 992
Friesland.....	332, 044		

EMIGRATION FROM EUROPE.

Statement showing the population of each province and of the Netherlands on the 1st of January, 1885, according to the registers of population.

Provinces.	Population.	Provinces.	Population.
North Brabant.....	491,023	Overijssel.....	285,280
Gelderland.....	490,905	Groningen.....	265,687

SOCIAL CONDITIONS.

A considerable proportion of the emigrants from this country to the United States are farmers, either land owners or tenants, who, I am assured, as a rule, go with more or less means, in many cases sufficient to purchase some land or small farms when they get to our side.

Such of them as have but little or no money, who are poor when they start, are hardly to be considered paupers, as they bring with them strong arms and stout hearts, a firm will to work, and are imbued with a spirit of manhood and independence.

It ought, therefore, not to be apprehended that such emigrants are ever very likely to become a charge on or a burden to any benevolent institutions, or to any city, county, or State government, on arrival at our shores, but, on the contrary, they, it will appear to me, are just the sort of people who make good citizens.

On this branch of the inquiry I am instructed not to confine myself to merely the emigrants, but to extend it and give information as to the general manner of living as regards housing, eating, and clothing, &c., of the whole population of the district.

In answer on this point I would state, in the first place, that the district which mostly contributes to the emigration comprises three provinces, those of Groningen, Friesland, and North Holland.

As to the general manner of living therein, it may be said that there are no very marked distinguishing features on the part of their population as considered to what it is on the part of the inhabitants in all the other provinces.

But if it is expected, as I doubt, that full and comprehensive information be given of the outside and inside of the palaces, residences, and villas of the aristocratic classes, the rich and upper middle classes, as well as of the plainer habitations, humble dwellings, and tenement houses owned or occupied by all the lower classes, including emigrants in the city and country; if it is expected to be fully and accurately described how and what each of these different classes of the population eat and drink, and how they clothe themselves, &c., then, I regret to say, my answer is apt to fall short of being satisfactory, and may disappoint the Department and the readers of this report.

To accomplish such a task in such a way would necessitate a sort of census to be previously taken, as up to this time there exists no published data, material, or statistics from which any such information could be adduced.

I trust, however, it will suffice when I state that the general manner of living, as regards housing, eating, and clothing on the part of the population in the above-named provinces, as well as in all of Holland, presents as great and similar contrasts between the most and least favored classes as it does in most every other country in Europe.

Side by side with ordinary comfort, great simplicity, and deprivation there exists the greatest comfort, elegance, and luxury; whilst many a workingman's family lives at a cost of 500 florins per annum, there are families whose yearly expenditures run up to 30,000 and 40,000 florins.

For further information on this point, and more particularly as to the manner and cost of living of the working classes, &c., I beg again to refer to what is stated thereon in my report of July 16, 1884, published in Consular Reports, Labor in

of marriages, divorces, children, natural and legitimate, from 1874 to 1884, inclusive, I compile statements from them as follows:

DEPORTATION OF CHRONIC PAUPERS OR INSANE PERSONS, ETC.

No case or cases of deportation of chronic or any paupers or of insane persons, with or without Government aid, have been brought to my knowledge or have been intimated to me during several years last past, and it may safely be stated, I think, that no such reprehensible practice is indulged in in these days, either on the part of the Government or public of this country.

Chronic paupers are not often met with in Holland.

Those who are pauperized through laziness, or habitual idling, soon turn either into mendicants or criminals, careers which generally and speedily lead to their becoming inmates of either work-houses and poor-houses, or of jails and other penal establishments.

For the treatment and care of the insane, rich and poor, male and female, most ample provision is made.

The insane asylums in this country and their general management are highly spoken of.

There are in all, as I am informed, eight such institutions in Holland, situated in different provinces, with a capacity varying as to convenient accommodation for from 200 to about 900 patients.

The largest one, located at Bloemendaal, near Haarlem, named "Meerenberg," surrounded by beautifully and usefully laid out grounds, consisting of about 100 acres, belonging to the establishment, contains at this time fully 900 inmates.

An additional building is now in course of erection there, at a cost of near 400,000 florins, which, when completed, in about two years, is intended to hold about 400 patients.

I visited this "asylum" a few days ago and am indebted to the kind-hearted, generous, and obliging director and "*Hinsmeester*" of the same for showing me around in nearly every part of it.

Whilst I cannot pretend to any particular knowledge or experience as to what insane asylums are in other countries, or as to what all they ought to be anywhere, I would not hesitate to state that to me it seems the "asylum" (*Gesticht*) "Meerenberg" deserves to be characterized a "model institution"; as nearly perfect in all of its appointments as, it would appear, such institutions can well be made.

Furthermore, Holland abounds in public and private establishments of every description, intended for the alleviation of afflicted and unfortunate sufferers, be they rich or poor, young or old, male or female.

Assisted emigration exists always to a more or less considerable extent. It may be divided in two categories, namely, such persons as are not only willing but anxious to emigrate, but who, without any fault of their own, require, receive, and accept assistance in order to realize their intention and object; and of such as are indifferent about emigrating or even opposed to it, but who are prevailed upon to go, and who, as it were, "are emigrated" by well-to-do relatives or friends supplying them the means.

The above first-mentioned class of emigrants is quite numerous, and may be said to compare favorably with others who go, and who are able to pay their own way.

The latter-mentioned class consists, usually, of a sort of never-do-good, indolent, or sluggish

ATTITUDE OF THE GOVERNMENT TOWARDS EMIGRATION.

From all that I have hitherto observed and learned I feel justified in stating that the Government of this country is perfectly passive as to the matter of emigration; it neither encourages nor restrains it. No impediments or obstacles of any kind are thrown in its way, so far as I know.

Several excellent laws, that of November 27, 1865, and of September 30, 1869, as well as two or three royal decrees, provide for and afford every protection to emigrants, particularly to such as are foreigners, and who come from over the borders to take ship in and depart from any port of Holland.

SPECIAL PRIVILEGES OFFERED TO INDUCE EMIGRATION.

From what is above already stated it will be obvious that nothing is done on the part of the Dutch Government to induce the emigration of any of its citizens. Neither are there, at this time, any corporations which are engaged to bring about emigration in any manner, at least none at all so far as I know and can learn.

The former passenger agents of the company whose ships ply between this port and New York made great exertions in that direction, but neither the company nor their present agents here attempt to cause or influence emigration in any way.

D. ECKSTEIN,
Consul.

UNITED STATES CONSULATE,
Amsterdam, May 31, 1886.

II.—EMIGRATION FROM AMSTERDAM TO THE UNITED STATES IN 1886.

Through the kindness of D. van Ketwich, esq., the superintendent of emigration at this port, who furnished me the required data and statistics I am enabled to prepare this report.

The total number of persons, men, women, and children, who emigrated to the United States via Amsterdam in 1886, was 4,647, as against 2,842 in 1885, being an increase in the emigration which took place in 1886 over that of the previous year, 1885, amounting to 1,805 persons.

They were all carried in the steamers Edam, Schiedam, and Zaan-dam, of the Netherlands-American Steam Navigation Company, in twenty-two trips, and all landed at New York.

The number of cabin passengers by same steamers and trips was in 1886, 1,040, whereas in 1885 only 243 cabin passengers were carried, which would show that the Amsterdam line is gaining in favor by the traveling public.

The 4,647 emigrants consisted of 2,546 men, 980 women, 906 children from one to ten years of age, and 215 infants.

As to their nationality may serve the following statement, viz:

Nationalities.	Number.	Nationalities.	Number.
			74

The number of 161 Americans put down in the foregoing statement should, it would seem to me, be deducted from the total number representing the emigrants, as the fact of their having gone as steerage passengers caused them to be, but erroneously, classed as emigrants.

The number of Netherlands who came to our shores last year was very near the same as in the year before; there were 771 in 1886 and 786 in 1885.

The following statement shows in what proportion each province contributed to the emigration in 1886:

Provinces.	Men.	Women.	Children (one to ten years).	Infants.	Total.
Groningen.....	57	36	51	8	152
Friesland.....	51	22	25	8	106
Drenthe.....	5	5	6	3	19
Overijssel.....	17	11	13	4	45
Gelderland.....	40	24	29	8	101
Utrecht.....	7	1	3	-----	11
North Holland.....	75	52	58	13	198
South Holland.....	26	15	16	6	63
Zeeland.....	17	12	10	2	41
North Brabant.....	15	9	9	1	34
Limburg.....	1	-----	-----	-----	1
Total.....	311	187	220	53	771

Of the 771 emigrants from Holland, 496 are recorded as being without any trade or occupation, namely, 171 women, 223 children, 54 infants, and 48 youths from ten to eighteen years of age.

As to the trades or occupation of the remaining 275 Dutch emigrants, they are thus stated, viz:

Occupations.	Number.	Occupations.	Number.
Farmers.....	131	Chimney-sweeps.....	3
Farm and other laborers.....	87	Butchers.....	2
Merchants.....	9	Servants, male.....	2
Carpenters.....	9	Millers.....	2
Bakers.....	4	Other trades.....	17
Servants, females.....	3		
Dyers.....	3	Total.....	275
Blacksmiths.....	3		

The average time in which the trips were made from this port to New York was fourteen and a half days each, and without any serious or noteworthy accidents happening during the year covered by this report.

The price for steerage passage, which, in the spring of the year, was 60 florins, or about \$24, was, in consequence of the Antwerp competition, later on reduced to 48 florins, or about \$19.20.

It is agreeable to me to be able to report that the laws and regulations touching hygiene and sanitation as to ships and passengers are being closely looked after and strictly carried out in this port.

For illustration I would mention a case which came under my notice in the course of the year. A young woman named Catherine Schaumburg, of Melsungen, by Cassel, Germany, with her infant, six months old, who had engaged and paid passage, was

character and endanger the health or lives of other passengers. Through the intermediation of the city authorities, the mother and child were placed in a hospital, where they remained until the child was restored to health, and they have since then continued the voyage.

EMIGRATION FROM THE PROVINCE OF FRIESLAND.

Last year, after receiving instructions from the Department of State to report upon the extent and character of the emigration from this consular district to the United States, I applied for statistics and material to different persons and at various places, and amongst them to his excellency Baron van Harinxma Thoe Slooten, royal commissary of the province of Friesland.

At the time I rendered my report upon the subject, May 31, 1886, I had not yet received any answer from him, but about two months afterwards it came.

In it the royal commissary conveyed to me such full and interesting information relating to the extent, character, &c., of the emigration from the province of Friesland that I concluded to translate his communication and append it to this present report and as supplemental to the report above referred to.

In fact ordinary courtesy dictates this course, as to withhold it from the Department would hardly be proper, after an officer of such high rank had the kindness to take the trouble to prepare it, upon my request and in the belief that it was intended for our Government.

It is as follows:

LEEWARDEN, July 29, 1886.

The UNITED STATES CONSUL, *Amsterdam*:

In response to your letter and request of the 24th of May last, I have the honor herewith to hand you a statement of the emigration from the province of Friesland to the United States, from 1876 to 1885, both inclusive, and a brief account of the social condition, &c., of the classes of people in the community which contribute more particularly to the emigration from this section, as well as more generally to the whole population of the province.

Statement showing the emigration from the province of Friesland to the United States, each year, from 1876 to 1885, both inclusive.

Years.	Communes.	Heads of families and unmarried men.	Circumstances of the emigrants.			Persons who accompanied heads of families and unmarried men.		
			Well to do.	Less well to do.	Needy or poor.	Women.	Children.	Servants.
1876.....	7	13	3	10		4	17	
1877.....	10	21	3	12	6	8	24	1
1878.....	3	4		2	2	2	6	
1879.....	6	8		7	1	6	9	
1880.....	18	114	7	73	34	66	224	1
1881.....	36	560	17	380	163	335	909	13
1882.....	32	399	14	310	75	189	537	39
1883.....	29	276	18	194	64	120	339	7
1884.....	33	197	7	134	56	71	235	3
1885.....	23	81	13	54	14	33	128	2

Most of the communes whence, as was also the case many years ago, emigration directed its course to the United States, belong to or are situated on and surrounded by the so-called alluvial or clayey soil; then follow some communes having diluvial or sandy soil. Only one commune occurs whence any emigration has taken place in recent years where the soil consists entirely or partly of peatbog.

MANNERS AND CUSTOMS.

For centuries the Friesians have been praised for their noble pride, firmness, and constancy, as well as for their courage in any contest, and for attachment to their native soil. To these they always joined a strong sense of liberty and independence, and "Free Friesians" was the appellation by which they were known to foreign nations, an appellation by which their posterity are still fond of being distinguished.

Religion has always been in Friesland an object of the highest veneration, as is evidenced by the great number of churches in the province and by the amount of property belonging to them.

Throughout many ages, for more than two thousand years past, the Friesians have been able to maintain their separate existence as a people. This has contributed in a considerable measure to the preservation of their above-mentioned chief characteristics.

While in most towns the Dutch language is spoken with a Friesian accent, the language of the country districts, excepting the commune "het Bildt," and places along the frontier, &c., is the vernacular or "Low Friesian," which originates from the "Old Friesian language," and which on account of its antiquity and its resemblance to the English and other northern languages, as well as on account of its force and sweetness, is held in great esteem by the people.

Great attention has been paid to its cultivation during the last forty to fifty years, and it has been highly progressive.

Industry, frugality, and economy are, in a large measure, amongst the distinguishing traits of the Friesians.

The Friesians do not always appear amicable or friendly, yet they are hospitable, frank, and kind to all who are favorably known to them. They are passionately fond of popular games and entertainments. Horse-races, skating-matches, boat-races, bowling-matches, and other diversions, affording an opportunity for the exercise and exhibition of muscular strength, are particularly popular with them. On such occasions the Friesian lays aside his habitual reserve and enters heartily into the sport, becomes sometimes even boisterous and indulges to excess.

MANNER OF LIVING.

In the years of great prosperity that preceded the late years of depression the way of living, even among the lower classes, was often anything but simple. However, the force of necessity has gradually again worked a change in this respect, and the former simplicity—living within one's income—has been returned to.

DWELLINGS.

In this regard many material improvements have been effected of late years, not only in the towns but also in the country. The dictates and requirements of hygiene in matters of dwellings and lodgings of every description as well as in factories and work places are being better and more attended to than in bygone days, the public authorities being now unfailing in exercising their prerogatives and influence in all proper cases.

SUBSISTENCE.

The chief articles of food of the lower and laboring classes are: Rye bread, potatoes, farinaceous food, beans, peas, cabbage, turnips, and carrots, &c., with a little fat or often only with a little oil. If their means at all allow it their diet also includes such articles as butter and Friesian cheese, fresh milk and buttermilk, besides coffee and tea. Meat of any kind, though of late years somewhat cheaper, enters but seldom into their dietary.

When their earnings permit of it and meat is used by them it consists only of the poorest cuts of beef or pork, at best of a little mutton, and, in the spring of the year, of the veal of calves twenty-four to forty-eight hours old (*nuchter kalfsvleesch*).

In places along the sea-coast and in those parts
ried on as a business f)

The style of living of the classes of the community in question is marked, to a certain extent, by striking irregularity.

In the summer months, when the earnings are greater, there are often persons and families who indulge liberally; pauperize themselves thereby, and are consequently amongst those who come around early in the winter to ask relief from the commune.

The extremes of excess and want go, to a considerable degree, hand in hand with plenty of earnings and none at all or scarcely any.

The agricultural classes, from which by far the greater number of emigrants are recruited, take, as a rule, four meals a day.

The first, breakfast, very early in the morning, then dinner at 12 o'clock, a light repast with coffee or tea in the afternoon, and finally supper before going to bed.

The articles of food are here, in the main, the same as above mentioned, but they are, of course, generally more carefully prepared, of a better and more nourishing quality, and taken in greater abundance.

In addition to rye or black bread one finds here also wheaten bread and biscuits, while meat is commonly the principal dish at dinner, and for which in winter salted meat or bacon is substituted. For supper the remains of the dinner are often served up.

There is quite a difference in the manner of living and general condition of the farmers and those whom they employ as determined by their being situated or living in a clayey or sandy and fenny district.

It is true that the number and order of the meals are the same, but the quality of the food consumed is usually much inferior in the sandy and fenny districts.

It may be stated that, as a rule, in the clayey districts, where the interests of the inhabitants consist more especially of cattle-breeding and dairy pursuits, and where consequently fewer hands are required to perform the labor, the wages are generally higher, and as result thereof the workmen can afford to live better.

It is self-understood that what is above said relating to the way in which workmen and laborers, &c., are usually living in this province is not regulated exclusively by their wages or earnings, but also in accordance with the number of members in any family and of how many of them are not alone able but, at the same time, willing and ready to work, or in other words, actually industrious.

Much also depends upon the domesticity and thrift of the female head of the family or steadiness of the husband; in short, upon the physical, moral, and intellectual condition of the head of the family and of the several members thereof.

Here, too, then, the diet is determined by more or less changeable, uncertain circumstances, and it is, therefore, on the whole most difficult to fix upon any general standard regarding the matter.

In prosperous times and in well-regulated families, in which the productive members stand anyways in due proportion to the consuming ones, the standard of living will, of course, be higher than in any opposite case or cases.

It may further be remarked that "the actual condition" of most of the agricultural laborers and their families is about "a medium," which lies between the extremes of pinching poverty and deprivation and "comparative prosperity."

In this connection I cannot well omit also to speak of a certain species of drink, which, though it ought and cannot be classified under the head of this chapter, yet holds an important place among the beverages of the people of the Friesland, namely, "spirituous liquors."

In general, however, the "abuse" of spirits is much less amongst the rustics than amongst the inhabitants of the towns.

The consumption of it in the clayey and fenny districts is greater than in the sandy districts.

Ordinarily the peasant will seldom drink spirits at home, but confines his potations to the tavern.

On receiving calls, and on visiting occasions, and when celebrating any domestic or public festivity, the use of spirits is never eschewed, not even by the women, who, when their husbands, sons, &c., drink gin, indulge in brandy and sugar, or liquors of some description.

The habit of using intoxicating drinks prevails much less on the part of agricultural laborers than on the part of the working classes in the towns.

It is only on public and domestic celebrations and on holidays that some belonging to the former class are allured, forget themselves and drink to excess.

From the above, however, no too favorable conclusion must be adduced concerning the consumption of spirits in the country districts of Friesland, as certain parts are

In conclusion of this paragraph I would remark that the rural population of all degrees are very fond of cake and gingerbread, great quantities of which are eaten in all sorts of forms.

CLOTHING.

The clothing at present worn by the different classes of the population differs but very little from such as is in use by the corresponding classes of the inhabitants in the other provinces of Holland, and this is more particularly the case as regards men's ware. In the country regions it is, generally speaking, very simple. Underclothing consists almost exclusively of some woollen material, and this, in the case of the workingmen, during all seasons of the year, as the climate of the country makes this most desirable if not necessary.

The country women still wear the time-honored Friesian head-gear, the so-called "ooryzer."

In the towns the use of this head ornament is vastly giving way to the ordinary and fashionable head dress of the period. When, however, the ladies of the upper classes, and even many of those less favored by fortune, do wear the head-gear in question, it is invariably made out of gold. Others wear the silver article. The price of a heavy "ooryzer," made of gold, costs often from 250 to 300 florins, and as added thereto there are often jeweled bands across the forehead. The whole ornament frequently represents great value.

POPULATION, MARRIAGES, AND DIVORCES.

The number of marriages during the last ten years has not kept equal pace with the increase of the population. That this is not an evidence of increased prosperity needs no further elucidation or comment.

In the years 1882, 1883, and 1884 there was, in the place of the former regular annual augmentation, even a falling off of the population. This did not occur in consequence of an excess of deaths over births, as in this respect Friesland is generally the most progressive province in the Kingdom; nor has it been caused by the "relative" mortality, but has been solely owing to the fact that a larger number of persons left the province than came to settle therein.

It may be assumed that amongst the first mentioned there were many who were induced to emigrate to the United States, or leave for and settle in other parts of the Netherlands, especially the metropolis (Amsterdam), in the hope of bettering their condition.

In spite of the decrease of population in 1883 and 1884, the number of marriages was no fewer than in 1881.

The number of divorces cannot be called large, but separations *a mensa et thoro* occur more frequently.

The figures in the following statement illustrate what is written under the next-above caption, viz:

Years.	Population on January 1.	Marriages.	Divorces.	Years.	Population on January 1.	Marriages.	Divorces.
1876.....	313,815	2,755	11	1881.....	331,515	2,341	8
1877.....	317,405	2,765	10	1882.....	329,309	2,262	12
1878.....	320,160	2,724	13	1883.....	329,237	2,349	17
1879.....	323,872	2,652	10	1884.....	329,130	2,341	10
1880.....	329,877	2,448	9	1885.....	330,866	2,370	13

I flatter myself that by the foregoing I have satisfied your wish, but should you desire further explanation or information upon one or another point I shall be ready and pleased to furnish it to you.

The royal commissary in the province of Friesland,

VAN HARINXMA THOE SLOOTEN.

D. ECKSTEIN,

Consul

UNITED STATES CONSULATE

NORWAY.

REPORT OF CONSUL GADE.

As this district, which embraces Southern and Eastern Norway and the best populated parts of the country, has always contributed by far the largest number of emigrants to the United States, I shall not confine my report to the emigration from this port or my consular district alone, but give at once an account of the whole emigration from its first beginning up to the present time.

No other country in proportion to its population has contributed so much to that of the United States as Norway. About sixty years ago, in 1825, a small craft left the port of Stavanger, in Western Norway, with the first emigrants for America. Some of these, belonging to the Society of Friends, had become dissatisfied with the restricted religious liberty in their native land. A portion of these Norwegian pioneers settled near Rochester, in the State of New York, while others made their way down to Texas. Ten years later other small bands of Norwegians settled in Illinois, Wisconsin, and Minnesota. These three States afterwards became, with Iowa, the principal homes of the many thousands of Norwegians who followed them. In 1840 the Norwegians settled in America still numbered only 1,200, but during the next decade the settlers, all of them belonging to the Lutheran faith, received ministers from the mother country and formed into parishes under the Norwegian Lutheran synod, when their number rose to over 12,000. About two-thirds of this number had settled in Wisconsin, where they bought land and prospered in agricultural pursuits. It is computed that in 1860 the Norwegians in America numbered about 60,000; in 1870 about 180,000, 115,000 of whom were born in Norway.

During the following period of five years, 1871 to 1875, the emigration statistics give the following results:

1871	11,606
1872	13,327
1873	10,097
1874	4,357
1875	4,048
Total	43,435

Of these 33,161 persons were from the rural districts in Norway and 10,274 from the towns. The emigration seemed to threaten to deprive Norway of her most useful hands when it reached the alarming number of 18,070 in the year of 1869, but during the following years it fell again to an inconsiderable number. The period of 1876 to 1880 shows nearly the same total figure as the previous five years, viz, 40,244, but it was the last year, 1880, which alone sent the large number of 20,212 persons.

The following table classifies the emigration from 1876 to 1880:

Years.	Men.	Women.	From rural districts.	Towns.	Total.
1876	2,402	1,952	3,823	532	4,355
1877	2,402	1,952	2,798	408	3,206
1878	2,402	1,952	2,798	408	4,863

It will be observed that the proportion between the peasantry and people emigrating from the towns remained about the same during the two last lusters, viz, four to one, though it has varied much in the single years. It may, however, be safely said that the emigration from the towns is increasing more rapidly than from the rural districts and they consist largely of artisans, clerks, and domestic servants. A very large proportion have been young people between nineteen and twenty years old.

We have now come to the period 1881-'85, when Norwegian emigration reached its climax and attracted general attention, not unmixed with apprehension of its possible influence on the population of the country. The official returns for this period give the following figures:

Years.	From rural districts.	From towns.	Males.	Females.	Under 15 years.	Total.
1881.....	18,272	7,704	14,910	11,066	7,182	25,976
1882.....	20,599	8,205	16,538	12,266	6,337	28,804
1883.....	15,983	6,184	12,358	9,809	5,798	22,167
1884.....	10,363	4,413	8,044	6,732	3,618	14,776
1885.....	10,079	3,911	7,272	6,707	3,477	13,987
Total						105,704

In 1882, when 28,804 Norwegians left their country, the whole population was estimated at 1,900,000, which gave about 1.5 per cent. of its inhabitants as emigrants to America. Not only the population received no increase by births during that year, but it really decreased by 4,000 individuals. Since 1814, when the country passed through the ordeals of war and famine, the country has been always regularly increasing. The large emigration in 1880, 1881, and 1882 may be expected to exercise an unfavorable influence on the growth of the Norwegian population for years to come, as the increase by births was very small during those years.

It can already be seen that the emigration in the present year will show a marked increase on that in the two previous years. The cause of it must probably be found in the favorable reports of better times in America, while a great depression in many branches of trade and commerce continues to reign in this country.

In examining which classes supply the largest number of Norwegian emigrants, we find that farm hands and agriculturists occupy the first place. The wages are but small and quite insufficient in the rural districts for a man with a family to support, and the prospects a young man has to become the proprietor of a farm through his own labor are so distant, if not quite unattainable, that he may well give them up altogether to join his numerous friends and relations in America. These friends, who in many cases own farms in their new homes and need more hands on them, write tempting descriptions of their prosperity in America and the ease with which a young man can improve his condition there, inclosing often prepaid tickets for the passage. The annual emigration statistics show that no less than about 50 per cent. of the emigrants are provided with tickets sent them from America. Traveling agents of the different transatlantic steamship lines carrying emigrants encourage the country population to leave their homes, and a fresh impetus has lately been given to emigration.

farm hands, there has been a serious lack of laborers in some of the country districts, and wages have risen in proportion. In many places this loss has been partially balanced by the introduction of modern labor-saving machines, but the proprietors, finding so many difficulties to struggle with, often follow the example of their laborers; for the Norwegian soil is not very productive, the summer is short, and the climate severe. Farming has, consequently, never proved a remunerative pursuit in these latitudes, and Norway, with a population of less than 2,000,000, is annually obliged to import cereals for about \$9,000,000. The prospects of the farmers are just at present gloomier than usual, on account of the large supply of cheap grain from America and other producing countries and the general depression in the prices of all agricultural products. Land is, therefore, selling at a heavy loss, while its former owners set off for the Far West.

It is but justice to say that America has gained in the Norwegian contingent of its emigrants, as the race is on the whole distinguished for its intelligence, industry, and the frugality of its habits. They are commonly accused of being slow and tenaciously attached to old habits, a natural consequence of their secluded life in solitary valleys of their native land. But from old times, when they first settled in Iceland and established other remote colonies, they have always proved useful and valuable settlers, ready to assimilate with the people in the land of their adoption.

Next to the agriculturists or "*bönder*," as the peasantry are called in this country, we find artisans of all kinds strongly represented among the emigrants. The official statistics for 1882 report that 1,496 artisans left in that year for America, of whom 150 were blacksmiths, 341 joiners, 129 tailors, 230 shoemakers, 159 carpenters, 96 painters, 75 masons, 71 bakers and confectioners, and 52 mechanics. In the same year 876 seafaring men emigrated, 167 fishermen, and 275 persons who had been engaged as tradesmen, clerks, &c. It is not to be wondered at that Norwegian domestic servants go to America in increasing numbers, as their wages at home are very low, varying from \$20 to \$40 a year for girls in the towns, and in the country they are even lower; 896 servants are thus reported to have left in 1882. Norwegians employed as servants prove generally honest, good-tempered, and trustworthy. They ought consequently to be especially welcomed in American homes. The principal, and I may say almost the sole cause that Norwegians leave their homes, is the desire to improve their material condition. Hardly any other nation in Europe has for the past seventy years enjoyed more peace and continued progress under free and truly democratic institutions than Norway, and no political disturbances or other social causes of dissatisfaction have been determining influences in emigration. The military service exacted from every Norwegian male at the age of twenty-two has never been so onerous as in other countries of Europe, and I believe it has rarely been a motive for emigration. According to law, persons liable to military duty must apply for permission before emigrating, but I have never heard that the Government has in any case refused it. If these emigrants should return to Norway while still within the legal age, they are required to offer themselves at once for

the military qualities of the Norwegian emigrants. they

children, representing a very large capital of money spent on their support and education, has been felt as a serious national loss. But the Government of this democratic land, where all political power has gradually passed into the hands of the people, has never thought of putting any restriction in their way. Nor, on the other hand, have the authorities encouraged emigration from the poorer districts, where the indigent are an excessive burden to the community. The taxes annually assessed for the support of the poor amount to over five millions of kroner, two-thirds of which go to the poor of the rural districts and the remaining third to the towns. Emigration would indeed be a relief in many cases, but there is no reason to suppose that paupers have ever been shipped from this country to the United States, though the poor boards in the rural districts may, in some instances, have aided poorer emigrants who had friends in America with small sums to make up passage-money. Emigrant agents and shippers here are well informed of the American emigrant law, and know that their own interests are best served by paying full regard to it.

No case has come to my knowledge of any released prisoner who has been sent to America from this country, either by the public or any societies for the care of ex-convicts. Undoubtedly many such are to be found there, but there is at least a better hope of their becoming honest, self-supporting citizens under new conditions and away from the scene of their temptation and failure.

GERH. GADE,
Consul.

UNITED STATES CONSULATE,
Christiania, October 19, 1886.

RUSSIA.

ST. PETERSBURG.

REPORT OF CONSUL-GENERAL YOUNG.

There is but little emigration from Russia, more perhaps to the United States than to any other country. The Government of Russia does not encourage emigration, on the contrary it prohibits all Russian subjects from leaving the Empire of Russia, except Poles and Jews. It does not encourage these in any tangible form, but allows them to leave with written permission. The Mennonites have emigrated perhaps more extensively than any other class of Russian subjects. The Mennonites came to Russia from Old Germany, principally from Prussia and Holland, about the beginning of the nineteenth century, and settled in Southern Russia in the districts of Berdiansk, Ekaterinoslav, and Saratov. There are about 50,000 in all. They are all industrious, thrifty, agricultural people, very quiet and peaceably inclined. They enjoyed comparative repose and freedom from interference till 1871, when it was ordered that the Mennonites should serve in the army. This they absolutely refused to do, not by violence or by any revolutionary means, but stoutly declared that they would not and the

issued

to believe that the Government is well satisfied and even anxious to get rid of its Israelite population, and when they go it is not with a blessing but with a kick and "glad to get rid of you." There is no register kept of persons who emigrate from Russia that I can get to examine. I think that none exists, and no idea can be formed of the number of emigrants for each year. A few Mennonites manage to slip out every year, and they make good citizens and generally leave this country with some means. Much cannot be said of their morality; they marry, it is true, but are exceedingly loose in their habits of life. The Poles are perhaps a shade better in their private relations and are an industrious people. It is my opinion that compulsory military service is the cause of most of the emigration from Russia, and perhaps the objection of many to the form of government, which is rigorous, but generally just in the administration of the laws, rules, and regulations, for really there are more rules than laws. The lowest classes generally form the greater part of the emigration. I might add that the manner of distributing the land is very distasteful to many people, and that is one cause of discontent. The land is let out in communities and owned by the communities, but not by individuals unless they are able to purchase in certain districts when land is for sale. The class that emigrate is very poor generally. Their general manner of living is quite primitive and plain. The majority of the poor people rarely have meat; they live on black bread made of rye, quite sour, and cabbage soup, and in summer other vegetables, principally cucumbers fresh and pickled in brine. In the winter they are clothed in sheep-skins mostly, and in summer cheap stuffs made of flax and cotton goods. I know of no emigration of "chronic paupers or insane persons." As before stated, there is no aid given to any class of emigrants from Russia. The obstacles in the way of emigration from Russia are the strict police regulations and the system of passports; all subjects, male and female, must have passports and renewed every year.

The entire frontier is guarded closely. No special privileges or rates of fare are offered by the Government or any corporation for aiding emigrants, and these circumstances prevent emigration. There is no system of emigration—none encouraged or assisted—but Jews and Poles are allowed to go when they have proper passports.

P. M. B. YOUNG,
Consul-General.

UNITED STATES CONSULATE-GENERAL,
St. Petersburg, August 6, 1886.

SWEDEN.

REPORT OF CONSUL ELFWING.

The emigrants from Sweden to America during 1851-'60 were 14,868, and during 1861-'65, 9,420.

Year.	Emigrants.
1851	14,868
1852

1861	9,420
1862	
1863	
1864	
1865	

DISTRIBUTION OF EMIGRATION FROM
SWEDEN IN 1884.

During the first six months of 1885 there were 9,403 emigrants. The total number during last year is not yet officially published. The first six months of the present year show a great increase in emigration, or, according to the newspapers, 17,693, but it is not all to the United States, and about 3,000 of these emigrants are foreigners, mostly Finlanders.

Of the classes which supply the greatest number of emigrants the agricultural is probably the largest, if agricultural laborers are herein included. The servants' class, particularly among the women, is also very large. Otherwise every class is represented, and may be thus classified: Servants, laborers, agriculturists, mechanics, engineers and architects, clerks, and merchants.

The cause of emigration is the belief that they can better their condition, and probably also a fondness for an adventurous life. There are no political causes, nor is it onerous taxation, nor a surplus population. Here is, to be sure, compulsory military service, but as it amounts to only thirty days, or fifteen days of service at age of twenty-one years and fifteen days at twenty-two, this cannot be the cause, particularly as every one after twenty-two years of age, since the military service is finished, is free to go wherever he pleases. Next year, however, a law will go in operation by which the time of actual service will be extended to forty-two days for the two years. A main cause of emigration is the fact that so many have emigrated, and these are constantly writing home asking their friends to follow, and also sending them tickets or money to go over with.

The pauperism of this country is not excessively large. The number of paupers was, in the year 1884, in the country, 4.88 per cent. of the population, and in the cities 6.96 per cent., or for the whole country 4.87 per cent. The total population of the country was 4,565,668 in 1880, of which 1,238,126 were land-owners, and the total agricultural population was 2,342,994. The total of the industrial population, or those that belonged to saw-mills, mines, iron works, textile-mills, &c., were 576,366. Those belonging to commerce, navigation, and transportation on land, &c., 222,291, and those to the administration, to the army and navy, clergy, &c., 206,693, &c.

The total number of marriages were, in 1884, 30,200, and those dissolved through divorce in the same year 241. Number of children born in 1884 was 138,754, of which 14,183 were illegitimate. In the city of Stockholm were 29.3 per cent. illegitimate. With Government aid nothing has been done towards deportation of chronic paupers or criminals, but I have heard of a few cases where a community has given money to paupers to go off to America and not be a burden to them. Also philanthropic societies for the relief of liberated criminals have paid the passage to America for such, but I do not think that such practices now take place any longer. Two such societies have even asked me to help them to get the criminal a start in America. The law of reshipping all such cases has undoubtedly put a stop to these practices.

The Swedish Government has done what it could to stop emigration, in that a law, which went in operation last year, decrees that no one can buy a ticket for America or Australia without first producing a certificate to the effect that he does not leave a wife or children unprovided for or unpaid debts, but that does not prevent any one from going to any other foreign place.

I do not think that any special privileges or rates of fare offered by Governments or corporations to induce emigration have much affected there the emigration from Sweden to the United States.

NERE A. ELFWING,
Consul.

UNITED STATES CONSULATE,
Stockholm, August 18, 1886.

SWITZERLAND.

REPORT OF CONSUL-GENERAL WINCHESTER.

Referring to the circular of the Department dated April 27th ultimo, and received on the 15th instant, this consulate general would state that it is impossible to make a very full or satisfactory report on emigration and the various conditions relating to and affecting the same in Switzerland. The machinery of the Swiss Government, national and cantonal, is very simple, limited, and economical. The investigation and statistics of the questions embraced in the circular do not approximate those of the United States in extent, detail, or accuracy.

Emigration from Switzerland was for some time on the decline, but showed a steady and marked increase from 1878 to 1883, inclusive; then a very heavy decline during 1884 and 1885. From 1873 to 1885 the emigration to the United States was as follows:

Year.	Number.	Year.	Number.	Year.	Number.
1873	3,460	1878	1,602	1883	11,619
1874	1,631	1879	2,964	1884	8,539
1875	866	1880	5,792	1885	5,934
1876	1,011	1881	9,996		
1877	1,027	1882	11,069		

The number of emigrants from Switzerland to the United States from 1873 to 1885, both inclusive, was 65,332; emigration to all other countries for the same period, 15,242; total, 80,574—80 per cent. going to the United States.

From July 1, 1876, to June 30, 1884, the various classes were represented as follows:

Occupation.	Number.	Occupation.	Number.
Farmers and laborers	14,410	Printers	71
Millers	234	Bookbinders	72
Bakers	635	Spinners and weavers	292
Butchers	666	Embroiderers	56
Brewers	209	Dyers	75
Gardeners	245	Watchmakers	406
Tailors and tailoresses	1,241	Machine engineers and technologist	251
Shoemakers	667	Mechanics	553
Barbers	77	Smiths	434
Washers and washerwomen	54	Cartwrights	122
Stone cutters	101	Clerks	2,056
	553	Saloon-keepers	423
			73

An average year shows the percentage of the trade classes to be: Producers, 50 per cent.; industries, 20 per cent.; commerce, 3.9 per cent.; personal service, 3 per cent.; without specification, 22 per cent.

The causes of emigration from Switzerland to the United States are to be found more in the latter than the former, and are chiefly its cheap and fertile lands, high wages, and the broader field and superior opportunities for obtaining competence and wealth.

The masses of the Swiss, as the result of a very excellent system of compulsory public education, are well informed, observant, and susceptible to the influences indicated.

There are contributory causes in Switzerland not to be overlooked. In physical respects it is not a bountiful motherland. Neither the climate nor the soil is good for agriculture. It is only by persistent, indomitable toil and strict frugality that the peasants can win a scant subsistence. Yet the best is made of it, and it is surprising how much the best can do. Everywhere are seen the proofs of active thought, method, economy, a ready hand, and all the evidence of prosperity in a frugal way.

The area of the country is 41,488 square kilometers, or 15,992 English square miles, giving an average density of population of 177 per English square mile. This density varies from 24 in the Grisons to 932 in the canton of Geneva, per square mile.

Thirty per cent. of the area is occupied by mountains, glaciers, lakes, and rivers. Of the total, only 51 per cent. is under cultivation.

The population dwell mostly in small towns, hamlets, and villages, there being only five towns with more than 25,000 inhabitants. Of the total population by the census of December, 1880, 2,846,102, of whom 1,394,626 were males and 1,451,476 females, there were engaged in agriculture and dairy farming 1,138,678, in manufacturing industry 976,052, in commerce 206,003, in transportation 112,440, in the public service 42,879, living on incomes and pensions 56,055, alimentation 86,837, and 24,926 without a calling, the remainder composed of mining, silk culture, the chase, and the professions.

Some districts are entirely pastoral; not a plow is to be found in them; neither are fruits or vegetables cultivated. Whilst there is perhaps no country more carefully tilled, it has profited but little from modern inventions. The implements of husbandry in general use are of quite a primitive fashion. Labor is cheap, and results are obtained by a patient expenditure of manual toil.

Great attention is paid to forest culture. The rocky mountain side is made to support as many trees as could possibly grow together on the space devoted to them, and each individual tree is carefully looked after and scientifically pruned and trained, so that they shall not interfere with each other, but each has its fair share of space and light. In this work nature aids man's labor and thought by giving to the forests an abundance of moisture, and between the frequent storms and showers abundant floods of sunlight and warmth. It is this that on the mountain sides enables trees to take root and grow to a considerable size on what apparently is little more than a barren rock.*

Emigration is of course stimulated to some extent by the activity and efforts of emigration agencies, of which there are 370 located in Switzerland; the pecuniary assistance doubtless extended in some cases by these agents and the special rates

The federal and cantonal governments do not interfere with emigration either in the way of restriction or encouragement, and have uniformly declined to engage in any colonizing schemes.

Previous to 1881 there was much complaint of objectionable and "assisted" emigration to the United States, but in April, 1881, there went into effect a law, passed by the Swiss Government, forbidding "agents to forward persons to whom the laws of the country to which they emigrate prohibit the entry."

It is gratifying to say that this law appears to be faithfully and energetically enforced by the Swiss officials, and observed by the agents to an extent that promises to remove the evil entirely.

No case of objectionable or "assisted" emigration has come within the knowledge of this consulate-general since July, 1885.

Compulsory military service cannot be said to exercise any material influence on emigration from Switzerland. This service is not distasteful or burdensome, partly from the natural military qualities of the Swiss and partly from the instruction in the elements of drill in the various national and public schools.

Stated as a broad principle, the liability to military service in Switzerland commences at the age of twenty and ceases at the age of forty-four.

The first twelve years are passed in the élite or first line, and the last twelve in the landwehr. Practically, the term of service in the first line has been reduced to eight years, and the men composing it are compelled to attend annually for a few days to undergo inspection and drill. The second line, or landwehr, have no exercises, but merely an annual inspection of arms. Every Swiss who does not perform military service personally is subject to an annual exemption tax. This tax consists of a personal charge of 6 francs, or \$1.16, and a supplementary tax in proportion to fortune or income. In no instance, however, is the sum total for which one individual is liable to exceed 3,000 francs, or \$579; and no fortune under 1,000 francs, or \$193, is liable to the tax; and 600 francs, or \$115.80, is to be deducted from the net income of every person who is liable. It is true that since the war against the first Napoleon, when the Confederation furnished a contingent of 15,000 to the allies, Switzerland has not been called on to draw the sword, and there are some who protest against what they term an unnecessary waste of money and time expended on its armed forces; but it is believed that a very large majority of the people are in favor of, and cheerfully comply with, the requirements of the military service, mindful of the warning contained in the reply of the chancellor of the German Empire, who, when asked in 1870 to what extent Swiss neutrality would be respected, said, "To the extent to which you yourselves respect the device of the Scottish order of the Thistle—*Nemo me impune lacessit.*"

The subject of military service has been dwelt upon at some length, for, as a rule, it is the most conspicuous cause of emigration generally from Europe to the United States.

Taxation in Switzerland is not onerous. The statistics as to marriage and divorce, children natural and legitimate, present no unusual or striking features. In 1883 the births were 81,974; deaths, 58,633; and the

The majority of those engaged in agriculture and dairy farming are comfortably housed, and are able to furnish themselves with suitable clothing and sufficient wholesome diet, pork, fresh and cured, smoked beef, or sometimes called "mummy beef," potatoes, cheese, milk, butter, bread, and a thin wine of his own production, are the principal articles of food.

The poorer classes of people subsist on food of a much inferior quality and limited quantity. Meager cheese, the curd that rises on the heating, after the first curd for the cheese has been removed, black rye bread, potatoes, soup from rice or flour, a very weak dilution of coffee, and potato spirits (a most pernicious distillation), constitute the normal fare of the laboring masses. Fresh meat cannot be reckoned as an article of consumption. It is confined to a very small class; and the numerous large public houses are a great and growing source of revenue to Switzerland.

The laboring man manages his scant and indifferent food to the best advantage, partaking of it frequently. In addition to the usual three regular meals, he has a lunch between breakfast and dinner, and dinner and supper, and then again before retiring to his slumbers.

As to strikes, they have never had any organized existence or influence in Switzerland, therefore could not have entered into the question of emigration.

With a few sporadic, insignificant symptoms, Switzerland has been exempt from the great, widespread labor unrest that has so alarmingly prevailed throughout Europe and the United States.

The subdivision of the soil among a multitude of small proprietors, for the most part energetic, industrious cultivators of their own holdings, largely contributes to render the Swiss people a happy and contented people. The soil of the country is so extensively divided among the population that it is estimated there are nearly 300,000 peasant proprietors, representing a population of about 2,000,000.

There is no country whose laws afford greater facilities for the acquisition and transfer of land. The general tendency is to discourage the centralization or accumulation of landed property in a few hands and to promote small farming as the best parent of general public contentment, happiness, and thrift.

This diffusion of landed property in Switzerland tends to give a great perfection to many social arrangements.

In the most insignificant hamlets and villages there will usually be found a post-office, a regularly-appointed watchman by night, public fountains, a market place, and a fire engine, in the use of which the people are exercised.

There are in Switzerland no instances of great wealth, no appearance of great ease and luxury, no rich and splendid aristocracy, but almost every head of a family, however humble his circumstances, possesses a home belonging to him in fee, with all of its civilizing influences. Pauperism as an institution is scarcely known.

There is pinching, but little actual distress among the industrious poor. As to those whose trade is poverty they are about the same everywhere, neither worse off or better off in any country.

The absence of any grinding poverty is no doubt partly owing to the natural independence of the people as well as to their industriousness, simple methods of life, and the influence of the religious and political institutions.

largely saves them at least from pauperism. If they were as wasteful, careless, and improvident as our wages supported class the ibex and chamois might soon return to the valley.

The Swiss are known to be ingenious in many kinds of workmanship, specially in wood-carving clock-making, and embroidery. They are keen not only in getting, but in keeping their money. An old proverb says, "It requires ten Jews to cheat a Swiss, and ten Swiss to cheat a Genoese." They present a remarkable and undisturbed type of old provincial life, with many curious survivals of customs and traditions, a deep distrust of innovation and what is new, adhering to a primitive way of doing the simplest things.

Industry, forethought, self-supporting energy, and reciprocal dispositions to neighborly help pervade the population. Brave, enduring, patient, law-abiding, kindly contented in the practice of their simple forms of life and faith, it may be truly said:

Yet still e'en here content can spread a charm,
Redress the clime, and all its rage disarm;
Though poor the peasant's hut, his feast though small,
He sees his little lot the lot of all.

All the statistics in this report cover the whole of Switzerland.

BOYD WINCHESTER.

UNITED STATES CONSULATE-GENERAL,

Berne, May 22, 1886.

ZURICH.

REPORT OF CONSUL CATLIN.

During the past forty years Switzerland has sent more emigrants to the United States than has France with thirteen times her population. On the other hand, Germany with sixteen times and Ireland with scarcely twice as many inhabitants as Switzerland, have during the same periods sent us respectively twenty-one and sixteen times as many emigrants as she. The following table shows at a glance the relative rate of emigration from Switzerland, as compared with the three other countries mentioned, viz:

Country.	Population.	Emigration* May 5, 1847 to January 1, 1886.	Rate per 1,000 inhab- itants.
France	37,405,793	138,959	3.7
Germany	45,238,829	3,113,787	68.8
Ireland	5,159,839	2,355,497	456.4
Switzerland	2,846,102	145,936	51.2

* This embraces the emigration to New York alone, but the additional emigration to the other American sea-ports would not materially alter the ratio.

Swiss transmarine emigration attained in 1883 its greatest propor-

ing which year the emigration was only one-third of what it had been in 1873. Then the tide steadily rose again until it reached its highest point in 1883, when it again began to ebb.

These fluctuations are unquestionably ascribable to the variable conditions, whether agricultural or industrial, existing from time to time in either or both of the two countries. In Germany a good year in crops or vintage invariably means a larger emigration to America, as it affords increased funds for the purchase of tickets and the other outlays incident to a change of home. The patriotic Switzer, on the other hand, values a good year as the means of enabling him to avoid emigrating and to remain all the longer among the mountains and valleys of his loved fatherland. The German, in other words, emigrates when he can; the Switzer only when he must.

One principal cause operating to swell the tide of German emigration is lacking in Switzerland, viz, the pressure of compulsory military service. However persistently the right of expatriation may be denied to the young Swiss who goes away to the United States, he is at all events not branded "deserter," as is his fellow-emigrant from over the border. Swiss military requirements are light, and their burden is easy to be borne; so easy, in fact, that to escape them is no inducement whatever to emigrate. We must look, then, for some other ground on which to base the comparatively high percentage of emigration from Switzerland, and it is to be found in the lack of employment resulting from industrial depression, in the difficulties of earning a subsistence, and in the inherent general desire on the part of every man to better his condition in life.

And first in regard to lack of employment. To a considerable extent the substitution of machine for hand labor has, by reducing the demand for the latter, been for years past steadily augmenting the ranks of the unemployed. But, and especially at the present time, the industrial depression in silk and cotton manufacturing centers has a still greater influence in the same directions. Take, for instance, the present condition of the silk industry of the canton of Zurich. During the last two years the number of firms engaged in manufacturing silk has fallen from 136 to 119, the number of employed from 50,396 to 39,084, and the amount of wages annually paid from 21,718,624 francs to 18,230,877 francs. In 1881 there were 19,168, in 1883 17,925, and in 1885 11,959 silk hand weavers employed in the canton. In other words, there were 7,209 fewer silk weavers employed in 1885 than in 1881, and the question naturally arises to what other means of livelihood these 7,209 have turned for subsistence. In a community where all the trades and occupations are overcrowded, where the supply of labor invariably exceeds the demand and where new enterprises or undertakings, such as the building of railroads, canals, or other great public works are lacking, the finding of new employment all at once for 7,000 persons in a single canton is practically an impossibility. Emigration, either to other cantons or to other lands, follows as a matter of necessity.

The difficulties and hardships which the lower and many of the rural classes in Switzerland encounter in the struggle for existence also contribute largely to swell the current of emigration to foreign lands. Switzerland can in no sense of the word be called an agricultural land. She does not produce in one year enough grain to supply her population for one-sixth of the period. Her

have been of late greatly enhanced by the opening of the *Arlberg* railway route, yet the deficit exists nevertheless, and always will, no doubt, unless some means can be found, which is not probable, of increasing the cultivable area of Switzerland. Now, with \$30,000,000 to be sent away into other countries for bread, it follows there must exist great industrial prosperity to balance the account and pay the bill. But where, as in the present instance, industries are depressed, payment comes hard, and bread becomes correspondingly scarce. Here is *another* great stimulant to emigration.

There is still another point from which this question may be viewed, viz, from that of the desire inherent in every man's nature to better his position where he can. To "better his position" consists, in the case of a young single man, in acquiring the means to marry and found a home and family. In the case of the man already possessing a wife and family, it consists in making some better provision for their joint welfare and maintenance. This leads us to a consideration of the prevalence of marriage in Switzerland. The annual percentage of marriages to every thousand inhabitants is somewhat lower than it was fifteen years ago. In 1871 it was 7.3, while from 1880 to 1884 it was annually 6.8, the rate in Germany being 7.8, in England 7.7, and in France 7.6. Marriage is, consequently, less prevalent in Switzerland than in either of the three other countries named; the ratio of marriageable women to marriageable men is that of 5 to 4. Of the men who marry 60 per cent. are between the ages of twenty and thirty, and 76 per cent. between the ages of twenty and thirty-five. This tends to show that as a rule young men in Switzerland do not defer marriage, awaiting a competency, as is the case in some other lands. It is also a noticeable feature of Swiss marriage that over 80 per cent. of the men who marry are drawn from the producing and industrial classes.

A study of these facts and figures inclines me to the opinion that the emigration of young men from Switzerland is no more influenced by the existence of hindrances to marriage than it is by a desire to escape military service. Industrial depression and consequent lack of employment are the causes principally operating to send yearly so many thousands of Switzers to our shores. The series of tables, I to IX, accompanying this report, will be found to illustrate more fully, and by cantons, the various figures which have been adduced. Should the present unfortunate condition of Swiss industries continue, and there is no present prospect of any great improvement, and in case no restrictions are in the near future placed upon emigration by our own Government, it is probable that during the next ten years we shall receive largely increased accessions of these hardy, thrifty, and industrious people, whose predecessors have already done so much to develop our resources and populate our great West.

In a recent report on the subject of Mormonism in Switzerland, I adverted at some length to the efforts now being made by missionaries from Utah to secure proselytes to their faith. There is reason to believe that within the last two months a considerable number of converts have left this country for Salt Lake, going by way of Berne (where they have their headquarters), and Basle. But their departure has been so successfully conducted, even to the sending away of their baggage, that it is possible for even the

venting their departure hence so long as they have committed no offense against the law and go of their own free will.

Cases of what was known as "assisted" emigration were formerly frequent, but now, thanks to the energetic action of the emigration authorities at New York, seem to have ceased altogether. During my service at this post only one case sufficient to arouse suspicion has come within my knowledge, yet even then a rigid investigation disclosed no grounds upon which to base a complaint or a demand that the parties be refused permission to land.

Switzerland, moreover, sends us few if any of the Anarchists and Socialists who of late years have thought to find in our Republic the soil favorable to the propagation of their pestilential doctrines. Her sons, reared to liberty, are slow to abuse it, whether in their own land or in that of their adoption. It has been stated that the man who threw the dynamite bomb in the Chicago riots came from the city of Zurich. I have no means at hand for either substantiating or disproving this statement, but if such be the case, it is quite possible that the person referred to is one of those hundreds of political refugees from Germany, or elsewhere, who, like the convicted Anarchist leader, John Most, have found it convenient to make a short stay here in Zurich, or some other Swiss city, before embarking for the United States. The exclusion of such persons were an easy matter could each emigrant be required, before landing, to produce documentary proof of identity, place of origin, previous occupation, &c., such as under the title of *Legitimations-Papier*, is exacted by the police authorities here or elsewhere throughout the greater part of Europe, as a condition of residence. It is the absence of some such requirement as this that has enabled thousands of irresponsible agitators and refugees to land unchallenged in the United States, and there with impunity, and without even the pretense of an acquired citizenship, to at once set about their work of subverting the priceless heritage of a Washington and a Jefferson. Happily, I say, for Switzerland, she sends us few or none of these firebrands. Her people are not in sympathy with the doctrines of anarchy, and should a general social revolution ever occur it would find no support from a population who like the Swiss have always upheld the principles of free government, and never tolerated the yoke of political bondage.

GEORGE L. CATLIN,
Consul.

THE UNITED KINGDOM.

REPORT OF CONSUL HALE.

STATISTICS.

The statistics of emigration from the United Kingdom are obtained by the Government from records required to be kept by the emigration officers at the ports of embarkation. No effort is made to keep separate records for the movement from the different counties or districts, otherwise than to discriminate between the three chief divisions of the Kingdom, England (including Wales), Scotland, and Ireland, and foreigners, the latter meaning chiefly persons from the continent of Europe who ship from British and Irish ports. Even this discrimination was not made until 1853; no record was kept of the return immigration until 1870, and no discrimination between nationalities in the latter until 1876.

The statistics for this district, therefore, can only be inferred from those for the country at large, and these it will be necessary to consider first.

The last annual report of Mr. Giffen, the statistician of the Board of Trade, made to that body in February, contained the following tables:

I.—Account of the numbers, nationalities, and destinations of passengers leaving the United Kingdom for places out of Europe, in 1885, in vessels under the passengers acts; including also passengers for places out of Europe, in vessels not under the acts, as far as the same have been recorded.

EMIGRATION FROM EUROPE.

XI.—General statement of emigration from the United Kingdom from 1815 to 1885, including British subjects and foreigners, with the destination of the emigrants.

[Prior to 1853 the nationalities were not distinguished, and this table is divided into two periods, one before the other after 1853, so as to facilitate comparison with the succeeding table, which shows the emigration of persons of British origin only.]

Year or period.	United States.	British North America.	Australia.	All other places.	Total.
1815-'20 (inclusive).....	50,359	70,438	(*)	2,731	123,528
1821-'30 (inclusive).....	99,801	139,269	*6,417	1,805	247,292
1831-'40 (inclusive).....	308,247	322,485	67,882	4,536	703,150
1841-'50 (inclusive).....	1,094,556	429,044	127,124	34,168	1,684,892
1851.....	267,357	42,605	21,532	4,472	335,966
1852.....	244,261	32,873	87,881	3,749	368,746
Total, 1815-'52.....	2,064,581	1,036,714	310,836	51,461	3,463,592
Total, 1853-'60.....	983,625	159,807	397,389	41,654	1,582,475
Total, 1861-'70.....	1,424,466	195,250	280,198	67,656	1,967,570
1871.....	198,843	32,671	12,227	8,694	252,435
1872.....	233,747	32,205	15,876	13,385	295,213

* The customs returns do not record any emigration to Australia during the years 1815 to 1824, inclusive, but it appears from other sources that there went out in 1821, 320; in 1822, 875; in 1823, 543; in 1824, 780, and in 1825, 458 persons. These numbers have not been included in the totals of this table.

XII.—Statement showing the number and percentage of persons of British and Irish origin only, who left the United Kingdom for the United States, British North America, Australasia, and all other places, in each year from 1853 to 1885, inclusive.

[Prior to 1853 the nationalities were not given.]

* Excess of immigrants.

I am indebted to Mr. Giffen for copies of each of his returns for the ten years from 1876 to 1885. Very able reports accompany these returns, the chief points of which may be thus grouped, epitomized, and commented upon:

THE LAW OF EMIGRATION.

North America its destination when trade is good.

In 1876, 143 more British and Irish returned to the United Kingdom from the United States than emigrated thither.

The emigration to Australasia, however—

Says Mr. Giffen in his report for that year—

has been of late comparatively steady, while that to the United States and North America fluctuates from year to year and period to period. The phenomenon may be not unconnected with the encouragement to immigration given by some of the Australian colonies, which operates in all years alike, whereas in years when natural causes promote a stream of emigration from European countries, the flow is to North America as the most easily accessible country.

In the report for 1879 the subject is continued:

The actual decline of immigration [says Mr. Giffen], at a time when emigration increases, appears important. It would seem to be a natural inference from this circumstance that there is always a certain amount of "tentative" emigration, and that of those who go away a larger number stay in the countries to which they depart in good times than in times when trade is depressed. Thus the diminution of immigration in a year like 1879 is a sign of the operation of causes which are likely to promote emigration for some time afterwards. By and by, as emigration increases, immigration will increase too, till at last, when the tide is again turning, immigration will be large in the face of declining emigration, and there will be a small excess of emigrants; but for the present, judging by past statistics, we seem to be at a comparatively early stage of a new tide of emigration. It will be seen [see Table XXI, page 407 of this report] that between 1870 and 1873 emigration and immigration both increased, but there was very little increase in the excess of emigrants; that in 1874 there was a large decrease of emigration coupled with a large increase of immigration, so that the excess of emigration showed a large diminution, the exact contrary of what is now occurring; and that from 1874 to 1877 there was a steady decline of both emigration and immigration, but more in the former than the latter, so that the excess of emigrants declined. It seems reasonable to infer that the present movement is likely to follow the same course, and will be followed by an increase of both emigration and immigration, accompanying a small decrease of both.

How accurately, however, even at that early day, Mr. Giffen discerned the rule, since more completely developed, will be seen by reference again to the table indicated above between brackets, viz, Table XXI, of this report.

It has already been stated incidentally [continues Mr. Giffen] that the principal part of the increase of emigration, as was the case last year, is to the United States and British North America, in which, as I had often occasion to point out in former reports, the chief falling off in previous years occurred. The point seems deserving of fuller statement. The inference from the former falling off was that the natural stream of emigration was to North America, and the emigration to Australia was only steadier because it was not so completely self-supporting; and this inference is apparently supported by the direction of the stream of emigration when trade becomes good. Almost all the increase goes to North America and very little to Australia. Thus, taking all emigrants, including foreigners, we find that out of a total increase of 70,000 in 1879 compared with 1878, no less than 53,000 is an increase of emigration to the United States and 9,000 to British North America, leaving only 8,000 as the increase to all other places, including Australia. The increase to America, moreover, is about 65 per cent., whereas to Australia it is very little over 13 per cent. Dealing with the emigration of persons of British and Irish origin only, we find that while the total increase as above stated is 51,372 persons, the increase to the United States only is 37,112 persons and to British North America 7,300 persons, leaving only 7,000 as the increase to all other places, including Australia. Here, again, the increase to North America is 69 per cent., and to Australia only about 12 per cent.

In his report for 1884 Mr. Giffen notes the great decline in emigration for that year, which he had foreshadowed in his report for 1883 as likely to occur, and proceeds:

The fact being thus evident that there is a general decline in emigration, which has practically been going on for two years and seems likely to continue during the present year, it may be interesting for a moment to consider how far the facts brought out in these tables correspond to what has been suggested from time to time as the reason for the rise and fall in emigration itself. What I have pointed out in former reports is that to all appearance emigration, as a rule, does not take place in times of the greatest dullness of trade, but rather in times of prosperity immediately succeeding a period of dullness, and that it begins to fall off again when depression returns. The reason may, perhaps, be that as the chief emigration takes place to the United States, and as the largest fluctuations are in the movements to and from the United States, then it is the state of trade there which determines the strength of the current of emigration from Europe at particular times. That state of trade, whether prosperous or the reverse, is likely enough to correspond with the state of trade in Europe itself. This being so, it would follow that emigration would take place from Europe when times are good, and not when times are dull. The reason, however, would be not that prosperity causes the emigration or dullness the decline of the emigration, but that it is the prosperity or dullness of trade in the United States, and in other countries to which emigrants proceed, which is the real operative cause. At any rate, the facts of the present time quite bear out this view. Trade has been depressed in the United States during the last two years, and is more depressed now than it was at the beginning of the period, and it is during these two years that the emigration from Europe has been declining, and that the immigration into Europe has been increasing; that immigration, it may be observed, being greatest from the United States. It is also plain that emigrants, consisting principally of laborers, are hardly likely to proceed to new countries in the years when there is no demand for them, and when, on the contrary, there is a great abundance of labor in these new countries. To some extent, also, I should say the figures as to emigration are affected by the occurrence of years of prosperity in this way, that in the earlier years of prosperity a considerable lending of capital from old to new countries goes on, and this lending of capital promotes emigration from the old countries to the new, helping to give greater employment for labor in the new countries than there would otherwise be. In this way an appearance of probability is given to the assumption that prosperity is the cause of emigration. There is no doubt, however, that prosperity in the way described is only a contributory cause. The main cause is the great demand for labor in new countries, and it is only a coincidence that it occurs from whatever cause, and it is only a coincidence that it occurs in the old countries.

account is taken of the countries from which the immigrants came. Such an account is presented in the following table :

XXIV.—*Number of immigrants of British and Irish origin that landed in the United Kingdom from foreign countries in each of the years 1877 to 1884.*

Countries.	1877.	1878.	1879.	1880.	1881.	1882.	1883.	1884.
United States.....	44,878	34,040	20,048	26,518	29,781	28,468	46,703	61,466
British North America.....	5,687	6,204	3,497	4,688	5,761	6,097	7,021	8,861
Australasia.....	4,637	4,207	4,967	5,910	5,877	6,871	6,844	8,312
Other places.....	8,688	10,493	9,424	9,891	11,288	13,275	13,236	12,717
Total.....	63,890	54,944	37,936	47,007	52,707	54,711	73,804	91,356

From this table it will be seen—and it may usefully be compared with the tables of emigration—that the chief fluctuating element as regards immigration is in the numbers coming from the United States.

In 1877 these numbers were 44,000, falling to 20,000 in 1879; since that date there has been a gradual increase until last year, the year of largest immigration of all, when the total was 61,000, or two-thirds of the whole immigration. No other destination shows changes at all corresponding, the difference in the immigration from all other places between 1879, the least year, and 1884, the highest year, being little more than 12,000. If it be true, then, that a large increase of immigration into this country means a decline in the emigration itself, and that the emigration in turn is determined by the want of employment in the country from which the immigrants return, then it must be evident that it is the state of affairs in the United States which is now diminishing the volume of emigration. Not only are the emigrants deterred from going to the United States by the state of the labor market there, but many people who have gone to that country are returning because they can find no employment at the present time.

The facts as to the immigration of persons of foreign origin are entirely in harmony with those in the above table. * * *

Reference has frequently been made in these reports to the peculiar character of the emigration to Australasia, which varies not quite in accordance with the emigration to the United States, and appears to be less exclusively determined by natural causes.

The emigration to Australasia last year was much smaller than it had been in 1883, but still a large figure; and but for the special emigration to Australasia neither would there have been the large increase of British emigration, which took place in 1883, from the United Kingdom, nor would the figure of emigration last year, small as it is by comparison, have been so large in reality.

The following table brings out this fact very clearly :

XXV.—*Destinations of excess of emigrants over immigrants among persons of British and Irish origin only in the undermentioned years.*

Country of emigration and immigration.	Excess of emigrants in—								
	1876.	1877.	1878.	1879.	1880.	1881.	1882.	1883.	1884.
United States.....	—*143	603	20,654	71,758	140,052	146,323	153,435	144,870	93,814
British North America.....	2,706	2,033	4,448	14,455	16,214	18,151	34,344	37,164	22,273

All other parts.....	5,885	3,168	584	4,133	5,995	9,016	6,458	—*140	—*1,207
Total.....	38,065	31,305	57,958	126,338	180,535	190,295	224,655	246,314	150,823

* Excess of immigrants.

Commenting in his report for 1879 on so much of the above table as was then prepared, Mr. Giffen called attention to the increase which had taken place in the immigration from the United States.

REGULARITY IN THE OPERATION OF THE LAW.

The peculiarity [here] is that whereas in 1884 there was an increase of immigration, which reached its maximum in that year, there is now a decline. This decline was fully anticipated in last year's report, there being a certain regularity in the rise and fall of emigration and immigration which suggested the anticipation. According to former experience, it was stated, all the figures for 1885 ought to be smaller than they were in 1884. It is too soon to affirm a general and unfailing law in the matter, but the regularity of the movement, which has now been additionally confirmed by the experience of 1885, is in every way remarkable.

From the statistics of emigration for the first nine months of 1886, given further on in this report, it appears that the stationary condition here anticipated has not taken place, but there can be no question about the correctness of the prediction, in this same report of 1885, that "if there is a revival of emigration soon, this revival, according to all past experience, will be a sure indication of returning prosperity in the United States and other new countries."

THE IRISH.

The position of the English and Irish contingents in the emigration of persons of British origin is exactly reversed from what it was. Ireland in 1853-'55 contributed 61 per cent. of the emigrants, England contributing only 30 per cent.; but now England contributes 61 per cent. as compared with the Irish proportion of 29. In 1876-'77 the proportions had risen for England to 67 and had fallen for Ireland to only 24, and it was then conjectured that the reverse of positions alluded to was due to the larger proportion which those who were not really emigrants contributed to the total emigration in years of low emigration as compared with years of high emigration. But what-

however, that the Irish figures, in proportion to the population of Ireland itself, remain very large. Ireland has less than a seventh of the population of the United Kingdom, but the Irish emigration is nearly a third of the total, and the lowest proportion it has reached was about a fourth in the years 1876-'79.

In his report for 1884 Mr. Giffen remarked upon a certain degree of change in the extent of the preference of the Irish for America, as follows:

It would appear that the change in the character of the emigration from the United Kingdom is accompanied, to some extent, by a change in the destination of the emigrants. In the years from 1861 to 1870 the annual average emigration of persons of British origin was about 157,000, of which 81,000 were Irish, and of these Irish emigrants the number proceeding to the United States was 69,000, while the number of English and Scotch proceeding to the same destination was 44,000. In 1883, however, the latest maximum year, the total emigration was 320,000, and of this only 105,000, or less than one-third, were Irish, so that although 83,000 of this number of 105,000 proceeded to the United States, the proportion proceeding to that destination was altogether not so large as it had been in the years when the Irish element preponderated. The proportion of English emigrants now proceeding to the United States appears to be not four-fifths, as is the case with the Irish element, but only about one-half, and it is the same with the Scotch emigration. In 1884 the proportion of English and Scotch emigrants proceeding to the United States was somewhat larger, but still nothing like the proportion in which the Irish emigration has that country for its destination.

In his report for 1882, however, Mr. Giffen devoted more than usual attention to the subject of Irish emigration, and what he had to say then will be found of great interest:

While the number of Irish persons emigrating, which showed a decline of about 17,000 in 1881 from the large total of 93,000 in 1880, increased last year to 84,000 [said Mr. Giffen], yet the proportion of Irish to the total emigration from the United Kingdom is rather less than it was in 1881, being nearly 30 as compared with 31 per cent.; it appears, in fact, that the increased emigration of persons of English origin amounts to 23,000, the total being 163,000, and the increased emigration of persons of Scotch origin is about 5,400, the total being 32,000, so that last year there were about 195,000 English and Scotch persons emigrating as compared with 84,000 Irish. The circumstances promoting emigration from the United Kingdom must thus be considered to have been very general, and not very specially connected with the condition of Ireland. The sudden increase of Irish emigration in 1880 remains an exceptional phenomenon, but the total which has been reached in 1882 may be considered as in correspondence with the general figures of the emigration from the United Kingdom.

While the Irish emigration has thus come to be due to much the same causes as that of the rest of the United Kingdom, though it is somewhat larger in proportion to the population, it would appear from a new comparative table which has been prepared, that there are interesting differences between it and the English and Scotch emigration, in regard, first, to the proportion of the adult single female emigration to the total number of single adults emigrating; and, second, to the proportion of the number of children to the total emigrants. Both in the English and Scotch emigration the excess of males over females among the single adults emigrating is very large. Among the English emigrants in 1882 there were 63,992 adult single males, as compared with 22,519 adult single females, the excess being no less than 41,473, or nearly twice the number of adult single females emigrating. In the recent years of high emigration also, it will be seen, the proportions were much the same, the excess of adult single males over adult single females emigrating being about twice the number of the females. In 1879 the excess was nearly three times the number of females. The figures as to the Scotch emigration are also much the same. The adult single male emigrants in 1882 of Scotch origin were 13,451, the adult single female emigrants 4,857, and the excess of males over females 8,594. When we come, however, to the Irish emigration, we find that the adult single male emigrants in 1882 were 34,937, and the adult single female emigrants were 28,605, the excess of males over females being thus 6,332 only, or less than a fourth of the number of females; similarly, in 1881 and 1880, the number of adult single female emigrants was 26,644 and 33,269 respectively, the excess of males over females being in each case about 4,600 only. It is plain, therefore, that while of the

emigrants of Irish origin abroad, while the effect on the Irish population at home must undoubtedly be to prevent so large a proportionate excess of females over males as there is in the rest of the United Kingdom. As regards children, again, the facts are that while the proportion of children to total emigrants, in the case of the English emigration, is rather more than 20 per cent., and in the case of Scotch emigration is very nearly 23 per cent., it is about 13 per cent. only in the case of the Irish emigration. Of equal numbers of emigrants, therefore, it will be found that a larger proportion of Irish than of English and Scotch emigrants are adults either of marriageable age or approaching marriageable age. The result of these two differences, viz, the greater proportion of adult single females emigrating from Ireland, and the smaller proportion of children in the total emigration, cannot but be to make the Irish emigration proportionately far more effective in retarding the growth of population at home than is the English and Scotch emigration. The Irish emigration is much more largely than the English and Scotch emigration the emigration of people at the marriageable age or approaching the marriageable age.

The above facts appear to throw light on the population statistics of Ireland. According to the Report on the Census of Ireland for 1881, page 15 of Part II, it appears that there has been no change since 1871 in the proportion of the population between twenty and fifty to the total population, which may be partly accounted for by the fact that between 1870 and 1880 the emigration was comparatively small, and it was only at the close of the decade that it began to increase. But it is found on comparing the statistics of Irish population with those of England that the proportion of adults, at almost all ages between twenty and fifty in Ireland to the total population, is considerably less than in England. For the whole period of life between twenty and fifty, the proportion in Ireland to the total population is about 36 per cent., while in England it is nearly 40 per cent. This may partly account for the fact of a lower birth rate in Ireland than in England or Scotland, as well as for a smaller excess of births over deaths, the proportion of people in the prime of life being smaller in Ireland than it is either in England or Scotland. The excess of births over deaths has also of late years been very small in Ireland, and much less than it was about 1871 and 1872. In those years the excess was about 60,000, the figures in 1871 being 62,945, but since 1878 the excess has ranged between 25,000 and 35,000, viz:

1878	34,488
1879	30,239
1880	25,180
1881	35,755
1882	33,978

These facts appear to be all in accordance with those which appear on the face of the emigration returns themselves, and to which I have now called attention. The difference in the character of the emigration from Ireland as compared with English and Scotch emigration has a distinct effect upon the birth and death rates and the growth of population in that country.

The question is one which belongs more properly to the statistics of emigration from Ireland, as stated in the annual return of the Irish Government, including the emigration to other parts of the United Kingdom as well as to foreign countries; but assuming that the above figures, which are those of the Irish emigration from the United Kingdom, correspond very nearly to the emigration from Ireland, considered geographically, it is to be observed that during the last three years the amount of the emigration must have been such as to cause a real diminution in the population of Ireland. It is much larger than the excess of births over deaths in those years, as the following comparison shows:

XXVI.—Comparison of Irish emigration from the United Kingdom, with the excess of births over deaths in Ireland.

Year.	Excess of births over deaths.	Number of emigrants.	Diminution of population.
1880	25,180	93,641	68,461
	35,755	76,200	40,445
	33,978	84,132	50,154

CONCERNING THE OCCUPATIONS OF EMIGRANTS.

In Mr. Giffen's report for 1876 occurs the following observation upon the classification of the occupations of emigrants, as given in the table under that head for that year, which, I take it, equally applies to the tables of "occupations" in succeeding reports, including Table V, given on page 169 of this report:

These figures as to occupations are necessarily somewhat loose, owing to the difficulty of getting the data properly registered in the first instance, and the numbers from whom no proper record of their occupation can be obtained. There seems no doubt, however, of the broad facts that the majority of adult male emigrants are laborers, and of single adult female emigrants domestic servants, though it would be difficult to insist on the minute correctness of the other classifications, or to draw any inferences from them.

BRITISH EMIGRANTS VIA THE CONTINENT.

Mr. Giffen calls attention, in his report for 1882, to the fact that his returns do not include a certain number of emigrants from the United Kingdom who take their passage to continental ports, and thence proceed, by shipping from those ports, to the United States. He had ascertained that during 1882 about 5,000 persons from the United Kingdom had gone to the United States by this route. The movement, however, has declined and shows no tendency to increase, being 2,969 in 1883, 1,806 in 1884, and 1,964 in 1885.

PROPORTION OF ADULTS INDICATING THE CHARACTER OF EMIGRATION.

In his last report for 1876 Mr. Giffen called attention to the fact that the proportion of adults, in the emigration to the United States for that year, was larger than the proportion of adults in the emigration to Australasia. This was regarded as evidence that the emigration to the latter country was more for permanent settlement than that to the United States. This was undoubtedly true at that period of abnormally low general emigration; but I find that in 1882, the year of maximum emigration, the difference had entirely disappeared, which seems to confirm, in a striking way, Mr. Giffen's theory as to the character of emigration to the United States in periods of small general emigration and large general emigration, respectively.

THE PASSENGER MOVEMENT.

The report for 1885 contains the following:

Reference has already been made to the fact that, one year with another, the passenger movement generally between the United Kingdom and places out of Europe, apart from what is properly called emigration and immigration, is on the increase. This is shown by the following small table, continued from former reports, showing the numbers of cabin and steerage passengers, respectively:

XXVII—Numbers of cabin and steerage passengers leaving the United Kingdom for places out of Europe in each of the years from 1876 to 1885, inclusive.

Years.	Cabin passengers.	Steerage passengers.	Total.	Years.	Cabin passengers.	Steerage passengers.	Total.
1876.....	41,900	96,322	138,222				
1877.....	41,900	96,322	138,222				
1878.....	41,900	96,322	138,222				

The figures show, as Mr. Giffen says, that the passenger movement is on the increase—advancing from 41,900 in 1876 to 51,428 in 1885. The proportion which the number of cabin passengers bears to the whole movement for each year, however, is in the other direction—the percentage declining from 30 in 1876 to 20 in 1885, after having touched 14 in 1881-'83.

STATISTICS FOR THE FIRST NINE MONTHS OF 1886.

The emigration returns to the Board of Trade for the nine months ended September 30, which Mr. Giffen has just sent me, are summarized in the return for September, which is as follows:

XXVIII.—Return of the numbers, nationalities, and destinations of the passengers that left the United Kingdom for places out of Europe during the month ended September 30, 1886, and the nine months ended September 30, 1886, compared with the corresponding periods of the previous years.

NOTE.—The above figures being made up at the earliest possible date after the close of each month, are subject to correction in the annual returns.

R. GIFFEN

COMMERCIAL DEPARTMENT, BOARD OF TRADE, October 5, 1886.

It will be observed that the total number of emigrants of British origin to all places out of Europe, which was 168,688 for the nine months ended September 30, 1885, is 188,359 for the same period this year—an increase of 19,691, or 11.67 per cent. But while the colonies receive this year 61,664 against 53,900 in 1885, an increase of 7,764, or 14.40 per cent., the United States receive 126,695 against 114,768, an increase of 11,927, or but 10.39 per cent. Separating the colonies, however, British North America has 21,862 this year against 17,909 last year, an increase of 3,953, or 22 per cent., while Australasia has 31,547 against 28,810 last year, an increase of 2,737, or but 9.5 per cent. Combining the United States and British North America, the figures are 148,557 this year against 132,677 last, an increase of 15,880, or 12 per cent. Or, following the method observed in Mr. Giffen's annual tables, the statement would show the relation which the British emigration to each country bears to the total British emigration in Table XII, page 175 of this report, as follows:

XXVIII a.

Date.	United States.	British North America.	Australasia.	All other places.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1885.....	66	10	19	5
Nine months of 1886.....	67	12	17	4

Again, the increase in the total English movement over last year's is 15.88 per cent.; in the Scotch, 19.04 per cent.; and in the Irish, 1.22 per cent.; while the increase in the English movement to the United States is 12.36 per cent.; in the Scotch, 30.01 per cent.; and in the Irish, 3.10 per cent.

THE DISPERSED ABROAD.

As an appropriate supplement to the foregoing statistics, I subjoin a table, prepared by Mr. John O'Neill for the October number of *The Nineteenth Century Magazine*, which displays in one direction—the horizontal—the numbers of born natives of each country who are now living out of that country, and at the same time in the vertical columns the numbers of foreigners who reside in each such country. Only the born natives of the parent countries, says Mr. O'Neill, have been considered, descendants of such emigrants becoming absorbed among the natural population of their adopted countries. The compiler hopes in these statistics, admittedly imperfect but the best to be had, to lay the foundation for those more elaborate and complete statistics which may be won at some future time, when advancing civilization shall give us, along with other international arrangements, the benefit of regulations for periodical and contemporaneous censuses, accompanied by uniform records of emigration, immigration, and re-emigration.

EMIGRATION FROM EUROPE.

XXIX.—Numbers of born natives of each country now living out of that country, together with the number of resident foreigners, and the balance in favor of or against each country.

The compiler makes the following comments on the above table, so far as it relates to America:

The born foreigners who are now in the American continents, north and south, amount to more than 13,000,000 out of our gross totals of nearly 19,000,000. United States immigration, which first sprang into great activity in the decade 1841-'50, reached its highest point, 730,000—2,000 a day—in 1882. In 1884 it had sunk temporarily, no doubt, to 461,000. At the same time it will be seen that these immigrant hosts have by no means permanently settled down, for 3,529,000 Americans now live outside their proper countries. It is to be regretted that the inconsistent modes of framing its statistics adopted by different countries preclude a complete analysis of the figures, which there was no choice but to amalgamate for the United States, Mexico, the rest of North America, and South America.

The emigration from Canada to the States is noteworthy, 1,000,000 having crossed the frontier before 1884 and 48,000 more in that year. Forty-four per cent. of the Canadian immigrants of 1881-'82-'83 passed on to the States. There are, per contra, 78,000 natives of the States in the Dominion. It is a significant fact that Mexico now holds nearly 2,000,000 of born Europeans, or 38 per cent. of her population.

As regards South America, Brazil showed an immigration, at Rio de Janeiro, in four recent years, of 93,000 Europeans, chiefly Portuguese, Italians, and Germans. But this is far surpassed by the Argentine Republic, which received in the same years 278,000 immigrants, mainly from Italy, Spain, and France. The numbers for 1884 were 103,000, whereas Brazil had only 18,000 in that year. In Uruguay the immigration is about 2,000 a year.

With the foregoing general statistics before us, it is now possible more accurately and understandingly to consider the subject of emigration in its specific relation to this consular district. For the reason, however, mentioned at the outset of this report, it is not possible to give statistics for the district of Manchester which approach accuracy nearer than may be inferred from a comparison (1) of the population of this district with that of England and with that of the United Kingdom, and (2) of the motives for emigration existing in this district with like motives in the country at large, so far as I have been able to ascertain a difference in them.

MANCHESTER'S SHARE OF EMIGRATION.

The consular district of Manchester, as will appear from the map, embraces the greater part of Lancashire, a considerable part of Cheshire, and small portions of Derbyshire, forms to what

Encyclopedia Britannica estimates at 800,000, and the remarkable group of industrial cities near by, which are represented in the Royal Exchange of Manchester and use Manchester as their market town. Chief of these are Oldham (111,000), Bolton (105,000), Blackburn (104,000), Preston (97,000), Rochdale (69,000), Stockport (60,000), Burnley (50,000), and Bury (52,000).* The figures given are those of the census of 1881. They would be some 10 per cent. larger now. The population of the district I estimate at 3,300,000 at the present time. It contains, therefore, a little less than 12 per cent. (11.8) of the population of England, including Wales (now 28,000,000), and 9 per cent. of the population of the United Kingdom (now something less than 37,000,000).

Assuming the causes of emigration to exist in equal measure in this district and the country at large, and applying the percentages just given to such of Mr. Giffen's statistics as are convenient for the purpose, the following table and subjoined calculations result for this consular district:

XXX.—Account in detail (on the basis of Mr. Giffen's figures for England) of the number and destination of passengers leaving the Manchester district in 1885, showing the number of adults and children of each sex and the conjugal conditions of the adults.

Description of emigrant.	United States.	British North America.	Australia and New Zealand.	East Indies.	British West Indies.	Cape of Good Hope and Natal.	Central and South America.	All other places.	Total.

Females	703	165	326	14	6	28	14	6	1,262
Total	8,707	1,748	3,348	242	130	348	238	135	14,896

* Salford is omitted, because included in Manchester.

Again, combining the totals of British (and Irish) emigrants as found in Mr. Giffen's tables of "occupations" for each of the nine years from 1877 (the first year in which the nationalities and occupations were both distinguished) to 1885, I get the subjoined table, which exhibits in its last column—9 per cent. of one-ninth of the totals—the average number of each class proceeding annually from the Manchester district:

XXXa.—Number of adults of each sex of British and Irish origin who left the United Kingdom for places out of Europe in each of the nine years beginning with 1877, and in all of said years, and of the average pro rata share of the Manchester district for each such year.

* By the "passengers acts" all persons twelve years of age and upwards are held to be adults.

So, also, it would appear (using Mr. Giffen's Table XV) that in thirty-three years, from 1853 to 1885, the Manchester district has sent abroad 527,016 emigrants, old and young. But from this number must be deducted the number of those who have returned. This can only be estimated as there are no records of immigration before 1870, and none of accurate estimate, however, than in Mr.

British emigrants returned, showing a somewhat greater proportion of "tentative" emigrants among the foreigners. While, therefore, as Mr. Giffen says, immigration has been increasing of late years, the rate of increase would, from these figures, appear to be very small, and 30 per cent. would doubtless be a fair estimate for the proportion of persons of British origin who have returned to their own land during the thirty-three years. Deducting this percentage from the number of emigrants as above, the net loss to the Manchester district would be but 368,911, or 11,000 per annum; a small number when compared with a population that has increased at an average rate of 40,000 per annum during the same period.

LOCAL PECULIARITIES.

When we come, however, to consider local peculiarities in connection with the motives for emigration, there are certain facts which would seem to qualify, in an important degree, the figures as given above for this district. For example, the Census of 1881 (page 43, Vol. IV) shows that there were, in round numbers, 500,000 persons in the Manchester district engaged in the cotton industry, or 17 per cent. of the total population of the district at that time, being just half of the number, 34 per cent. (Census, Vol. IV, page 101), engaged in every kind of industry. Of the male adult emigrants who were sufficiently identified with the cotton industry to be classified as such, viz, as "spinners and weavers," the table just given above shows that from 1877 to 1885 there were but 2,707. Assuming that all of these went from this district, and that all the weavers were cotton weavers—an assumption in excess of the truth, of course—we have an average of but 300 of such persons out of a total of 9,431 of all occupations, or 3 per cent., or, including the females, an average of but 315 out of a total of 15,533, or 2 per cent. While, therefore, as Mr. Giffen is quoted in an earlier part of this report to have said, it would be difficult to draw inferences based upon the minute correctness of the classifications of occupations, the difference between the 2 or 3 per cent. thus liberally obtained and the 17 per cent. above is so great that a wide margin is left after making all allowance for such of the 1,612 male and 4,487 female emigrants whose occupations are not stated as may have been of those classified by the census as connected with the cotton industry.

Again, the Lancashire people, who constitute the bulk of the population of the district, are not a migratory people, as is evident from the fact (Census, Vol. IV, page 101) that of every 1,000 natives of the county enumerated in England and Wales 904 were still resident in the county, whereas of the 44 "registration counties" in England and Wales none other had as many as 900, and but two had over 800 of such residents.

Further, Lancashire has a larger proportion of its population engaged in industrial occupations, and a smaller proportion in agricultural, than any other of the forty-four registration counties—the percentage of the former being 34 against 24 for the whole kingdom, and of the latter 1.8 against 5.3 for the whole Kingdom. In the forty-five registration districts, including London, it has, also, next to London, the highest percentage in the "commercial class," and, except Bedfordshire, the lowest percentage (53) in the "unoccupied class." And it is the industrial and commercial classes that the peculiar economic laws of England—which by the way, had their origin here in Manchester—

the advantages of life in this consular district would naturally offer to the inferior temptations of America and the colonies. The Census Report (Vol. IV, page 59-60) shows that Lancashire and Cheshire have contributed but 1 per cent. of their natives to London, which is a smaller percentage than that contributed by any other counties. After explaining that propinquity is the chief factor in determining this migration from the counties to London, the report proceeds to say that the small contributions of Lancashire, Cheshire, Yorkshire, Durham, Derbyshire, and Staffordshire resulted not merely from the fact that "those counties were far off, for there were counties quite as far off that made larger though still small contributions. An additional cause was that the counties mentioned had attractions of their own; they were centers of industry and retained a more than average proportion of their natives at home."

And, finally, the people of Lancashire have a greater pride in their county—without doubt resting upon more than a sentimental foundation—than the people of other sections of England, so far as my observation extends, and, other things being equal, would hesitate more before leaving it.

On the other hand, the Irish residents in Lancashire constitute 6 per cent., and in Cheshire $3\frac{1}{2}$ per cent., of the populations of these counties respectively, while the percentage of the Irish residents for the whole of England and Wales is but a little over 2. And the Irish, as we have seen, emigrate in larger numbers in proportion to population than the British.

Such are the indications of theory, which, it will be observed, with exception of the last mentioned, all point in one direction.

Local information, so far as, by diligent inquiry, I have been able to command it, supports the theory.

For example, Miss Emily Faithful, who has charge of the Manchester branch, for the northern and midland counties, of the Colonial Emigration Society, writes in reply to my inquiries:

I do not think the people of Lancashire emigrate in proportion [to those of the rest of the Kingdom], certainly not as far as the women are concerned.

Miss Faithful's efforts, before coming to Manchester, had been chiefly directed towards the emigration of women, but the distinction she suggests is in harmony with the fact that while of the total number of adults emigrating from England and Wales 40 per cent. only are females, 60 per cent. of all the persons engaged in Lancashire's chief industry are females.

Mr. J. T. Jordan, who enjoys opportunities for extensive and accurate information, writes:

As regards Lancashire, the emigration of cotton-factory operatives has been very small during the past two years, owing to their being well employed and earning good wages, the low cost of provisions and low rents for their cottages, provisions being very much lower than ten years ago, and rents fully 30 per cent. less. The iron trade having been in a depressed condition the last two or three years, there has been a comparatively large emigration of operatives in this department of trade, and many of this class travel very often backwards and forwards according to the state of trade in this department in the two countries. The same may be said of stone masons and builders. As regard paupers, you may put them down as an unappreciable quantity, and as far from hence if they wished. Farm laborers are an increasing quantity, and the farming industry does not improve.

Philadelphia, Pa., and Cohoes, near Troy, N. Y. There has been no emigration so far to the cotton-mills in South Carolina and Georgia, although I expect in the future an exodus to some small extent in that direction. There is a sufficient quantity of labor to be found at present among the poor whites in those two States; yet it only requires a beginning to start the outflow in that direction, the operatives here being of a gregarious nature and only requiring a bell-wether to lead the way.

To measure the bearing of the foregoing statements upon the point under consideration, it will be necessary to keep in view the proportion of the population of this district engaged in the several pursuits enumerated. As nearly all of the population of the district is comprised within the Lancashire part of it, and the Lancashire part of the district is that part of Lancashire which is most densely populated and which otherwise, except, possibly, as to the commercial class, chiefly determines the peculiarities of Lancashire, the figures for the whole of Lancashire will be found to be as nearly accurate for the Manchester district as need be, the small Cheshire and Derbyshire rural contingents being thus more than offset. Taking, therefore, the figures for Lancashire, the "unoccupied" class (largely composed of women having no definite "occupation", and of children under five years of age) is smaller in Lancashire, as has already been stated, than in any other county with the single exception of the small county of Bedford, being 53 per cent. of the total population. Of the remaining 47 per cent., 5 per cent. are enumerated in the "commercial" class, 4.7 per cent in the "domestic" class, 1.8 per cent in the "agricultural" class, 1.7 per cent in the "professional" class, and 34 per cent. in the industrial class.

Of all this industrial army, between a third and a half (quite half in the Manchester consular district) are engaged in the cotton industry; while the iron and steel trade claims but one-twentieth part of it (Census, Vol. III, p. 356); and, giving the silk industry the benefit of the addition of the whole number engaged therein in its stronghold, Cheshire, its quota is little over one-fiftieth part. It will be seen, therefore, that a comparatively large emigration from the last named two classes would exert but a small influence upon the general result. To take an extreme illustration: There were connected with the silk industry in Lancashire, Cheshire, and Derbyshire in 1881, 10,000 persons less than in 1871. If the whole of this loss, or 1,000 per annum, occurred from emigration (which of course is not the fact), it would make little difference one way or another with the total emigration of 20,000 adults per annum from those counties, or with the 15,000 per annum from the Manchester district.

[It may be observed with respect to the above calculations that the census figures for the four counties which contribute to make the area of this consular district could not be combined to any useful purpose, so widely do those counties differ in many characteristics and in the extent of their respective contributions to the total population of the district. The figures for Lancashire very fairly represent the district; for the district contains over three-fourths of the population of Lancashire, and seven-eighths of the population of the district are in Lancashire. The general effect of the figures, however, would be heightened were the same statistics accessible for the district. For example, there would be found more of the industrial element here than in the Liverpool end of the county, and less of the Irish—the census showing that Liverpool contains 1,262 out of every 10,000 Irish persons enumerated in England and Wales, and Manchester 686. I have used the

substantially to the same effect, I select a letter from Mr. Samuel Andrew, secretary to the Oldham Master Cotton Spinners' Association. Mr. Andrew gave evidence of very great importance before the royal commission on the depression of trade, and is probably the best authority in England on the subjects of which he writes as below :

As to the condition of the people of the cotton spinning and manufacturing district of which Oldham is the center, it may be said that, generally speaking, during the last quarter of a century it has considerably improved up to the present year. The working classes have generally become better off on account of having regular work and receiving good wages. At present a dark cloud overhangs the cotton trade and this is causing some irregularity in the working of some of the cotton-mills, but the amount of actual distress from this cause is only small compared with the number of people engaged in the cotton trade. The cost of living in recent years has been very moderate compared with that of former periods in the history of the trade. Add to this fact that the savings of the working classes have generally been invested in undertakings which as a rule have returned good interest, say in loans to cotton and other companies and building and money clubs. The iron trade of the district, though not so brisk as in some former years, has for the most part found regular employment for those engaged in it. To show the industrial nature of the population which surrounds Oldham, it has been estimated that the earnings of the whole population are about 7s. per week for every man, woman, and child, so that it may be said that every one gets his or her own living, and perhaps something to spare. The higher class of the population which lives on independent means seems to get smaller every year, while the class which includes the working population, or what has been at one time the working population, seems to have taken the place for the most part of what was called the higher class of former days.

In recent years there has not been much emigration among the working classes of Oldham. In former years, before the period I am now speaking of, there was considerable emigration, and the few emigrants who now leave Oldham for America do so, as a rule, to join members of the family who have succeeded well in America and have sent for their relatives left here behind. The reason alleged why working people do not emigrate is that, as a rule, a workingman can do better in England than in America, taking cost of living into account. The few who do emigrate, otherwise than as above described, are chiefly of the Irish element, many of whom are verging on pauperism and are neither well housed, well fed, nor as a rule well clad, and for the most part are unskilled laborers.

THE SMALL EMIGRATION FROM THE MANCHESTER DISTRICT.

I conclude, therefore, that emigration from this consular district is not so great in proportion to population as in the rest of England, and that the figures as given in my tables, constructed on the basis of Mr. Giffen's tables for the whole country, require reduction to a greater or less extent. The difference appears to be chiefly the result of the preponderating influence in this district of the cotton industry, in which, it would seem, the laborer manages to extract a larger share of the joint earnings of capital and labor than his fellow in America.

Inquiry into the cause of the difference which it would seem exists between the ratio of emigration from the cotton, iron, and silk trades respectively—a subject too long for discussion here—may well engage the attention of students of political economy. Briefly, however, it may be pointed out that the agreement between the facts as they have been discovered to exist here and certain general facts well known to exist on our side of the Atlantic is so obvious and complete that they seem to bear the relation to each other of cause and effect. For example, the

production, and therefore of earning, which constant improvements in the machinery he uses bestow upon him. Were it not so, the increase in the pressure of population, strengthened yearly to an enormous degree, would drive him from home in numbers many times greater than at present. In the silk trade, on the other hand, American production has not yet caught up with American consumption, and emigration proceeds in greater proportion from Macclesfield to Paterson—the probability being that, except for the increasing pressure of population, the laborer would not emigrate at all, whatever the capitalist might do with himself and his idle looms.* So, in the iron trade, the correlated facts give even greater evidence of mutual sympathy, the fluctuations in that industry—overproduction in which in America is not yet a steady condition, owing to the vast and irregular demands of railway building—being in keeping with the passing back and forth of laborers in it, noted by Mr. Jordan. That is to say, ocean transit is now so cheap and easy that the laborer seeks work where he can find it briskest and has the world to choose from.

I have, in one sense, given undeserved prominence to the silk industry, considering that, in a broad view, it can hardly be said to have emerged from the condition of an exotic; for, while the cotton industry absorbs one-twelfth of the whole industrial population of England and Wales, the silk industry employs less than one-hundredth part of it. But nearly half of all those engaged in this industry in the Kingdom are in the Manchester district; and for this reason, and because of the contrast its condition offers to its huge fellow textile, I have given it a prominence not accorded to industries greater than it.

CLASSES WHICH SUPPLY EMIGRATION.

From what has been said, it is plain that in a district like this, in which the industrial element so largely predominates, and the agricultural forms such an inconsiderable portion of the population, it must be the industrial class which supplies the greater portion of whatever emigration takes place. So, also, Mr. Giffen's table of "occupations" of emigrants would indicate the same fact—to a less degree, however—for the whole Kingdom. But it will be seen that the term "industrial" should be taken in a restricted sense.

Under the head "concerning the occupations of emigrants," I have already quoted Mr. Giffen's observation that "the figures as to occupations are necessarily somewhat loose, owing to the difficulty of getting the data properly registered in the first instance, and the numbers from whom no proper record of their occupation can be obtained." "There seems no doubt, however," continues Mr. Giffen, "of the broad facts that the majority of adult male emigrants are laborers, and of single adult female emigrants domestic servants."

Following out this idea, I have sought to minimize the effect of the looseness referred to, and yet to secure a reasonably satisfactory determination of the ratio of emigration to population of each of the classes contributing to the sum total of emigration, on the broader lines suggested. A table in the census of England and Wales divides the population into male and female, and these each into six classes, designated as the "professional," "domestic," "commercial," "agricultural," "industrial," and "unoccupied." In Mr. Giffen's tables, on the contrary, the emigrants are classified under forty-nine ~~different~~ ^{different} all to be found in the

other of the great classes mentioned; but, inasmuch as some of these subdivisions are aggregated in Mr. Giffen's tables—for example, "gentlemen, professional men, merchants, &c.," include members of two at least of the census classes—I have chosen for the males (1) the "industrial" and (2) the "agricultural" classes, in which there is no confusion of classification as between the two systems; (3) "all other occupied classes," in which I have aggregated the "professional," "domestic," and "commercial" classes of the census on the one hand, and all such of Mr. Giffen's "occupations" as the census subdivisions indicate should be included under one or other of these three classes, on the other hand; and (4) the "unoccupied" class of the census, with whom I compare Mr. Giffen's figures for those whose occupations were not stated to the emigration officers. For the females I have made a somewhat different classification, substituting the "domestic" class (in which, of the "occupied" classes, the females predominate) for the "agricultural" (of which the females form practically no part).

A careful study of the census report on the "unoccupied" class, in connection with the figures given in Mr. Giffen's tables for those "emigrants whose occupations were not stated," will show how closely the figures for such emigrants conform to what might be expected from the census analysis of the class from whom they would appear to have been drawn. Says the Census Report (Vol. IV, page 49):

The [unoccupied] class comprised 14,786,875 persons, or 57 per cent. of the entire population, the females in it being to the males in proportion of rather more than two to one.

It included, in the first place, 8,930,851 children and young persons under fifteen years of age, most of whom were simply unoccupied in the sense that they were as yet preparing for the various businesses of later life. Secondly, it included 532,441 others who were fifteen but under twenty years of age, and of whom also a large proportion were preparing for active life. Thirdly, it included 676,393 persons who were sixty-five years of age or more, and of whom a large number had been engaged in business, but had retired. Excluding these three classes of persons there remained 4,641,190 who were twenty but not yet sixty-five years of age, that is to say, who were in the working prime of life, and yet were without special occupation. Of these, however, 4,458,908 were women, of whom by far the greater part were married and engaged in the management of domestic life, and who can only be called unoccupied when that term is used in the limited sense that it bears in the census returns. Many more of these women, though unmarried, were also engaged in domestic duties, or were assisting their fathers or other near relatives in the details of business.

Of the 182,282 males in the working period of life (20-65) without specific occupation, a large number, doubtless, were busily engaged in avocations which were none the less serious or less important because not recognized in our classification. They were managing their estates and property, directing charitable institutions, prosecuting literary or scientific researches, or engaged in other of the multifarious channels by which unpaid energy finds vent. If these were deducted from the 182,282 unoccupied males, and a further deduction were also made for those who were incapacitated for work by physical defects, the remainder, constituting the really idle portion of the community, would probably prove to be but very small.

In close conformity with the above it will be seen, in the table given further on, that the male emigrants, whose occupations were not stated, formed but 0.27 per cent. of the male "unoccupied" class of the census, whereas the female emigrants whose occupations were not stated formed 0.44 per cent. of the female "unoccupied" class of the census, many of whom, doubtless, were the wives or adult daughters of the

This suggests an important restriction of the term "industrial," and I have accordingly subdivided the "industrial" class into "general laborers," and the "industrial class exclusive of general laborers."

And, finally, assuming that the Scotch and the Irish censuses would not strictly follow the same method of classification as the English census, I have added to the figures in the English census the percentage (35.7) by which the population of the United Kingdom exceeds that of England and Wales. This is rendered necessary by the fact that the nationality of the emigrant is not distinguished in Mr. Giffen's tables of "occupations." Doubtless the relative proportions of the six census classes differ somewhat in Scotland and Ireland from those of the same classes in England and Wales. But the natives of the several nationalities are intermingled to a considerable extent—1 per cent. of the population of England and Wales being Scotch, and 2 per cent. Irish born, while the English and Welsh born supply 2 per cent. of the population of Scotland, Ireland, and the islands in the British seas; and the population of England and Wales so predominate (74 per cent.) in the total for the United Kingdom that the divergence from the actual facts cannot be very great.

With this exception, and the trifling exception to be noted later in the report, the comparison shown in the following table is believed to be as accurate as the census and the emigration tables from which its figures are deducted:

XXXI.—*Distribution of the population of England and Wales, according to sex, in several classes as distinguished in the census of 1881; the distribution of the population of the United Kingdom in the same classes reckoned upon the basis of the classification for England and Wales, and the amount and rates of British and Irish adult emigration from each class as averaged for the past nine years.*

Sex and class.	Population of England and Wales in 1881, as distributed in several classes.	Population of United Kingdom in 1881, as distributed in the same classes on the basis of their distribution in England and Wales.	Average number per annum during the past nine years of British and Irish adults emigrating.	Ratio of adult emigration to population.
MALES.				
Industrial class (including general laborers)	4,795,178	6,505,980	60,010	<i>Per ct.</i> 0.92
General laborers (included in industrial class*) ..	559,769	759,481	42,599	5.61
Industrial class exclusive of laborers*	4,235,409	5,746,499	17,411	0.30
Agricultural class	1,318,344	1,788,667	10,715	0.60
All other occupied classes	1,670,124	2,265,983	16,159	0.71
Unoccupied class, or those whose occupation was not stated on emigrating	4,856,256	6,588,849	17,911	0.27
Total	12,639,902	17,149,509	104,795	0.61
FEMALES.				
Domestic class	1,545,302	2,096,628	17,030	0.81
Industrial class	1,578,189	2,141,248	427	0.02
All other occupied classes	280,427	380,478	485	0.13
Unoccupied class, or those whose occupation was not stated on emigrating	9,930,619	13,473,621	40,854	0.44
Total				

This table brings out very clearly the broad facts stated by Mr Giffen, viz, that the majority of adult male emigrants are laborers, and of [single] adult female emigrants domestic servants. It also shows that while the "industrial" class, including the general laborers, contributes, in proportion to its numbers, 50 per cent. more than the "agricultural" class, it contributes, excluding the general laborers, but half as many in proportion; and the general laborers not only constitute three times as many as either of the other classes of male emigrants, but they contribute of their home population the great proportion of 6 per cent. Again, if the number of children under twelve years of age who emigrate (about 20 per cent. of the number of adult emigrants) be added to the number of adults, making the total 207,000, it will be seen that the general laborers constitute 20 per cent. of the whole number of emigrants. In conformity with this fact, the census shows that had the laboring class, including agricultural laborers, increased in the ten years 1871-'81 in the same ratio as the general population, there would have been 239,000 more of them than were enumerated in 1881.

So, of the females, twice as many of the "domestic" class emigrate, in proportion, as of the "unoccupied" class, though the actual number of emigrants of the latter is three times as great as that of the former. As before suggested, however, many of the female emigrants, whose occupations were not stated, and whom I have compared with the "unoccupied" class of the census, are doubtless wives and daughters of male emigrants, and go to swell the number of domestic servants upon arriving at their destination.

For those who care for a more detailed explanation of the classifications in the foregoing table it may be added that I have grouped the subdivisions in Mr. Giffen's tables under the larger classes of the census as follows:

MALES.

Census classification.	Classification in emigration tables.
Industrial class.....	Bakers, confectioners, &c.; blacksmiths and farriers; boot and shoe makers; braziers, tinsmiths, &c.; brick and tile makers, potters, &c.; bricklayers, masons, &c.; builders; butchers, poulterers, &c.; cabinet-makers and upholsterers; carpenters and joiners; clock and watch makers and jewelers; coach makers and trimmers; coopers; engine drivers, stokers, &c.; general laborers; locksmiths, gunsmiths, &c.; mechanics; millers, maltsters, &c.; miners and quarrymen; painters, paper-hangers, plumbers, &c.; printers; saddlers and harness-makers; shipwrights; general smiths; spinners and weavers; tailors; tanners and curriers; turners; wheelwrights and millwrights; other trades and professions.
Agricultural.....	Agricultural laborers, gardeners, carters, &c.; farmers and graziers.
All other occupied classes	Clerks and agents; domestic servants; engineers; gentlemen, professional men, merchants, &c.; lawyers; seamen; shop-keepers, shopmen, warehousemen, &c.; army and navy.
Unoccupied class.....	Those whose occupations are not stated.

FEMALES.

Domestic class.....	Domestic and farm servants, nurses, &c.
Industrial class.....	Milliners, dress-makers, needlewomen, &c.; shopwomen; spinners and weavers.
All other occupied classes	Gentlewomen and governesses; other trades and professions.

ustrial" class, whereas the "professions" belong to the "all other occupied classes." On the other hand, "gentlemen" are included in the "all other occupied classes," whereas some of these may belong to the "unoccupied" class; and "shopkeepers" are included in the same class, though, if they had been distinguished from "warehousemen" in the emigration tables, they would have been included, as the "general shopkeepers" of the census, in the "industrial" class.

So, of the females, "other trades and professions" are not separated in the emigration tables, and therefore the "other trades" do not go under the "industrial" head, as otherwise they would.

An examination of the relatively small figures for these mixed classifications, however, will show that the confusion in respect of them can have no appreciable effect upon the result.

CAUSES OF EMIGRATION.

Having ascertained with sufficient accuracy the classes of the population which supply the greatest number of emigrants, the solution of the question of the causes of emigration is comparatively easy. And in considering the latter it will be seen that much light in turn is thrown upon the condition of the particular portion of the several classes which supplies the emigration.

Of the four chief supposed causes of emigration—compulsory military service, onerous taxation, strikes, and surplus population—the first two in no wise affect emigration from the United Kingdom. There is practically no compulsory military service here of any kind, the statute which authorizes the selection of militiamen by ballot, in cases where the militia quota of a particular county or district is not voluntarily filled, being temporarily suspended, and the regular army being raised entirely by voluntary enlistments. So, also, in the matter of taxation, the people of this country enjoy unusual immunity. Comparative tables* for the different civilized nations, recently published, show that the ratio of national and local taxation to gross earnings is less than 9 per cent. in England, considered apart from Scotland and Ireland; 9 per cent. in Denmark; 10 per cent. in the United Kingdom, Holland, and Sweden and Norway; 11 per cent. in the United States, Russia, and Belgium; 12 per cent. in Germany and Austria; 15 per cent. in France; 18 per cent. in Portugal; 21 per cent. in Spain; and 25 per cent. in Italy. So that, if we consider England alone, taxation is here lighter in comparison with the earnings of the people than in any of the countries named; while in the United Kingdom, considered as a whole, it is next to the lightest.

Again, if we consider the incidence of taxation upon the class which supplies emigration in comparison with that upon the upper classes, it will be seen that the laws of this country very greatly favor the former. A table derived from the same source as the figures just given shows the incidence of taxation in England, Scotland, and Ireland, and in the United Kingdom, upon the rich, the middle class, and the working class, respectively, per capita, and in comparison with income. The numbers of each class, says the compiler, Mr. Mulhall, are determined according to the results of legacy returns for 1877 in the three kingdoms, though the other figures are for 1881.

*By M. G. Mulhall.

XXXII.—Incidence of taxation in the United Kingdom on the three classes of the population.

Classes of population.	Numbers.	Taxes.	Income.	Ratio taxes.	
				Per head.	On income.
Incidence on the rich:					
England.....	966,000	£14,190,000	£286,000,000	\$71 54	4.96
Scotland.....	121,000	1,816,000	30,000,000	73 01	6.05
Ireland.....	72,000	1,175,000	14,000,000	79 44	8.40
Total.....	1,159,000	17,181,000	330,000,000	72 06	5.16
Incidence on middle classes:					
England.....	7,654,000	25,324,000	381,000,000	15 09	6.70
Scotland.....	967,000	3,930,000	49,000,000	19 78	8.02
Ireland.....	860,000	3,405,000	34,000,000	19 25	10.02

Ireland.....	4,228,000	3,995,000	36,000,000	4 56	11.10
Total.....	24,364,000	30,041,000	456,000,000	5 97	6.63

STRIKES.

Strikes affect emigration from this country to some extent, but my information leads me to believe to a degree hardly worth taking into account. In the first place, as Mr. Giffen has clearly shown, it is not bad times (if we take strikes as evidence of bad times) in England which swells the tide of emigration; it is good times on our side of the Atlantic. And, in the next place, as strikes, in this district at least, are merely business contentions between two kinds of capitalists, the individually big and the individually little, the effect of a prolonged strike is chiefly to shove down the upper classes of unskilled laborers, whose places are thereupon occupied by the lower classes of the laboring small capitalists, and the movement proceeds downwards until a certain portion of the lowest orders of the "general laborers" is driven from the field of labor and into the ranks of the paupers. The bulk of the strikers, on the contrary, are abundantly able to endure the consequences of their action, which after all is deliberate and generally not an altogether unfriendly passage at arms. To such an extent was this true of the great strike last year of the Oldham spinners, which lasted thirteen weeks, that a number of the strikers, as I am informed, took advantage of the holiday to make pleasure trips across the Atlantic to visit their less fortunate brethren in America. The statistics of emigration, it will be observed, are altogether in conformity with this statement of the case; while the statistics of pauperism for last year show an increase of paupers throughout England and Wales as the result of the depression of trade which provoked the strikes.

Again, as the benefits of good trade are disproportionately manifested in the case of the working classes, so it would be natural to expect greater distress

1880, in comparison with the national income, but 67 per cent. of what it was in 1850.

PRESSURE OF THE POPULATION.

The incidental pressure upon the laboring class, occasionally caused by strikes among those above them in the industrial scale, which I have just described, illustrates that irresistible pressure of increasing population which, after all, is both the cause of modern British emigration and determines its character. The only wonder is that the emigration is so small. For, other things being equal, the pressure of rapidly increasing population upon an area to which the sea sets immovable limits, would increase, not in arithmetical, but in geometrical, progression. A familiar illustration will make this plain. If there are one hundred vacant houses in the community and ninety-nine applicants for houses, the applicants command their own terms. But if the number of applicants be increased to one hundred and one, the increase of rental demanded is not as 101 to 99, but is abnormally greater. In such case, however, the building of two more houses relieves the pressure. In the case of the newly-born Briton, not an acre can be added to the land.

The decrease in the emigration from Ireland is also in conformity with the view just stated, and the readiness with which the movement from the United Kingdom has responded to the influence mentioned, in conformity with the varying degrees of pressure of population in its several parts, is—making due allowance for such disturbing causes as the continuing effects of the Irish famine and the late war in our country—remarkably exhibited in the following table:

XXXIII.—*Ratio to population of British emigration in the three past decennial periods, and the rate of increase of population in those periods.*

United Kingdom.	Emigrants.			Ratio of emigration to population.		
	1851-'60.	1861-'70.	1871-'80.	1851-'60.	1861-'70.	1871-'80.
				<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
England	640,000	650,000	971,000	3.4	3.0	4.0
Scotland	183,000	158,000	166,000	6.1	4.9	4.7
Ireland	1,231,000	867,000	543,000	20.1	15.5	10.2
Total	2,054,000	1,675,000	1,679,000	7.3	5.5	4.8

United Kingdom.	Increase of population.			Inhabitants per square mile.			
	1851-'61.	1861-'71.	1871-'81.	1851.	1861.	1871.	1881.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>				
England	11.9	13.2	14.4	307	344	390	446
Scotland	6.0	9.7	11.1	94	100	110	122
Ireland	*11.8	*6.7	*4.4	205	181	169	161
Total	5.6	8.8	10.8	227	240	261	289

* Decrease.

population from the census; those for the number of inhabitants per square mile, for England, from the census; for Scotland and Ireland, the census giving none, from Mr. Mulhall; for the United Kingdom, the census and Mr. Mulhall giving none, they are calculations based upon Table 47 of the census, Vol. IV, page 112.

As will be seen, the ratio of emigration to population in the United Kingdom has steadily declined during the thirty years, notwithstanding the greatly increased pressure of the population, which was 227 to the square mile in 1851 and 289 in 1881. In the case of Ireland, the ratio of emigration to population fell off 50 per cent. in the thirty years. At the same time a reduction of only 25 per cent. in the apparent pressure of population took place—from 205 to the square mile, in 1851, to 161 in 1881. But this disparity is entirely in keeping with the theory of a disproportionate progression in the pressure, as already explained. When, however, the case of England is considered, whose area would seem long ago to have reached the limit of endurance, supporting a greater population to the square mile, twenty years ago, by 10 per cent. than any other of the nations of Christendom, except Belgium, supports to-day, and now containing nearly double that of Italy and more than double that of Germany and France, it is cause for astonishment that the rate at which it throws off its population has scarcely increased at all. The laws of the land for the United Kingdom, but especially for overcrowded England, must have been adjusted to the needs of the laboring man with consummate skill to produce such a result. The fact, however, is altogether in conformity with the large number of like import to which attention has been already drawn.

DECLINE IN THE ATTRACTIONS OF THE UNITED STATES TO THE LABORING MAN.

It is the unskilled laborer, as we have seen, whom this country chiefly sends to us, the better class to the United States, and an inferior class to those colonies which find need for tempting immigration with assisted passages, the unskilled laborer who, within the limit of ability to transport himself, is furthest removed from partaking of the benefits which the remarkable economic system of this country seems to confer upon industrial merit. Under the pressure of the overcrowded population it is the survival of the fittest in the struggle to stay at home, and yet not the unfittest leave. These also remain as paupers. Fortunately for the emigrant laborer, whatever be the effect upon those with whom he comes into competition, the laws of most of the lands to which he turns his face, unlike those of the province of Minas Geraes, in Brazil, which impose a heavy tax upon his tools of trade, welcome him free of duty. But so they do his superior in industrial skill who refuses to emigrate. That is to say, it is commonly supposed they do. Perhaps, after all, the spinners and weavers in America pay a duty without knowing it. Manifestly, either the profits of manufacturing in America are much less than here, which ought not to be, seeing it is the land of raw material, or something in the laws or other forces controlling the American laborer, keeps down his share of the profits to such an extent

consigns him to work upon the cruder materials and in the cruder ways that the workingman can ever afford to avail himself of the imitation, and we have seen how even he would refuse it were it not that the fecundity of his race somewhat outruns the fertility of its industrial resource.

It will be interesting in this connection to compare the statistics of immigration into the United States from the two nations which contribute two-thirds of all our immigration, viz, the United Kingdom and Germany, with the insignificant numbers contributed by another of the chief nations of Europe, viz, France. The subjoined figures, extracted from Table No. 22 of the report of the Chief of the Bureau of Statistics for the three months ending March 31, 1886, make the comparison very striking:

XXXIV.—*Summary of aliens and immigrants of British, German, and French origin, respectively, carried in the United States by decades from 1821 to 1880.*

Nationality.	1821-1830.	1831-1840.	1841-1850.	1851-1860.	1861-1870.	1871-1880.
United Kingdom.....	75,803	283,191	1,047,763	1,338,093	1,106,970	989,163
Germany	6,761	152,454	434,626	951,667	822,007	757,698
France	8,497	45,575	77,262	76,358	37,749	73,301

Using Mr. Mulhall's tables of populations, another table may be constructed which will show the ratio of the above figures to population, as averaged for three double decades from 1821 to 1880, as follows:

XXXV.

Nationality.	Average population, 1821-1840.	Ratio of 20 years' emigration to population.	Average population, 1841-1860.	Ratio of 20 years' emigration to population.	Average population, 1861-1880.	Ratio of 20 years' emigration to population.
United Kingdom.....	23,625,000	1.50	27,635,000	8.63	31,690,000	6.61
Germany	28,315,000	.56	33,500,000	4.14	40,835,000	3.87
France	32,241,000	.17	35,696,000	.43	37,360,000	.30

The percentages in the above table, given under the head of "ratio of twenty years' immigration to population," represent the proportion which the total emigration for twenty years bears to the average population during those years. The ratio of annual emigration will be found by dividing the percentages by 20. The figures are so small that this is not convenient. Besides, the result of such division would not affect the purpose of the table, which is to show the relative progress of emigration from the three countries named during three representative periods. The extent of these periods has been made long enough, it is thought, to minimize, if not entirely to obliterate, the effect of transient causes. A glance, however, at the figures by decades, as well as at the figures by years, as given in the table appended, would suggest that the indication shown in the table of double decades would become only the more pronounced the more minute the comparison of figures:

XXXVI.—Immigrants arrived in the United States during each year ending June 30, from 1877 to 1885, inclusive, of British, German, and French origin, respectively.

Year.	United Kingdom.	Germany.	France.
1877	38,150	29,298	6,856
1878	38,082	29,313	4,159
1879	49,968	34,602	4,655
1880	144,876	84,638	4,313
1881	153,718	210,485	5,227
1882	179,423	250,630	6,003
1883	158,092	194,786	4,821
1884	129,294	179,676	3,608
1885	109,508	124,443	3,493
1886	112,548	84,403	3,318
Total	1,113,659	1,222,274	46,453
Average per annum	111,366	122,227	4,645

It will be convenient, however, to confine the comparison to that which is made in the table of double decades.

There are three general conditions upon which emigration depends, under one or other of which heads all the specific causes of emigration must fall. These (of importance inversely to the order of mention) are: (a) Dissatisfaction of the emigrant with his own country. (b) Facility of means for relief from such dissatisfaction, chiefly the comfort, cheapness, and speed with which his destination can be reached, but, also, measurably, the attitude of the Government which he abandons, and that of the Government which he proposes to adopt. (c) The attractions of the country of destination.

Considered with reference to these conditions, the figures of the table show a very remarkable uniformity in the response which the emigrant makes to the prevailing condition of the period, whether he be British, German, or French. The uniformity, however, is not remarkable at all, but only natural, if it be borne in mind how universal is the application of the great laws which govern human action. The figures show that the Briton, the German, and the Frenchman instantly availed themselves of the remarkable increase of the facilities of ocean transit which began to be developed in the early part of the double decade 1841–1860, in which period they found at the same time increasing benefit from the attractions of America. The figures also show that the Briton expressed his appreciation of the suddenly developed advantages of this period by increasing his emigration nearly 500 per cent. over his emigration in the preceding period 1821–1840. The German by increasing his emigration over 600 per cent.; and even the Frenchman, whose emigration is so small as scarcely to be expected to sympathize with the general movement, by increasing his emigration 150 per cent.

Coming to the next period, 1861–1880, the first two conditions of emigration—viz: (a) Dissatisfaction with home, arising, in modern times, as has been abundantly demonstrated, chiefly from pressure of population; and (b) facility of transit—exist in this period with so much greater force than in the preceding period, that unless conditions (c) (attraction of the country of destination) be changed, it should be found that the United Kingdom and Germany, at least, had

the United Kingdom and in Germany, and what contrast the increase in these three presents to the almost stationary condition of France:

XXXVII.—*Inhabitants per square mile.*

Countries.	1820.	1840.	1860.	1880.
England and Wales.....	203	270	340	440
United Kingdom.....	172	221	240	290
Germany.....	124	145	174	217
France.....	148	165	175	180

(b) With respect to the increase of facility of transit it is unnecessary to do more than allude to the vast changes that occurred during the period under consideration, 1861–1880; the greater speed and safety with which the ocean could be crossed as compared with the preceding period; the smaller outlay required, and the better fare in return, law-ordered comfort substituted for the ancient horrors of the steerage; the arrangements for reception on landing in keeping with the advancing civilization of the age.

(c) But since, notwithstanding the enormous increase in the motives of emigration as dependent upon pressure of population and facility of transit, the figures show that the ratio of emigration, instead of greatly increasing actually declined, it follows that a great and unfavorable change has occurred in condition *c* (the attractions of the United States).

The figures further show that while the attractions of the United States had declined in the ways of both nations, the Briton was able to express his sense of the decline by decreasing the ratio of his emigration 23 per cent., whereas some counteracting force in Germany compelled the German to content himself with expressing his sense of the decline by decreasing his ratio of emigration only 6 per cent.

Why the United States should have become so much less attractive to the kind of people who emigrate, viz, the laboring classes, in the period from 1861 to 1880, as compared with the period from 1841 to 1860, is a subject which need not be entered upon here. Attention being called to the evident fact, the incentive to remove the cause will be greater to those who have the power to do so.

It may be observed that “pressure of population,” as used in this connection, is not altogether a uniform standard by which to draw comparisons between different nations. For example, one nation may have greater natural capacity for supporting a dense population than another. But if a certain long-past period is taken as the starting point for each nation, and the population of each increases in the same proportion, then the increase or decrease of the dissatisfaction of the laboring classes will depend upon the capacity of the governing powers to offset with wholesome laws the burden of increased competition. Some qualifications of this may be made, however.

Thus, in the case of England, the same rate of increase would cause a much greater intensity of pressure (as more fully explained further on under the head of “health”) than in Germany; for the density of population in England alone (446 in 1881 to the square mile) is almost at the limit of endurance, while Germany’s (less than half that of England and 25 per cent. less than that of the United Kingdom) is still at its margin.

by England. Again, the attitude of Government in Great Britain is most favorable to emigration, while the demands of great military establishments in Germany and France permit emigration in a grudging way which finds its extreme manifestation in Russia and Turkey, where no subject can emigrate without the Czar's or the Sultan's permission.

The general conclusion from the foregoing is plain: That the population of France increases so slowly (it has been stationary since 1860) that the law-makers of that country find no difficulty in meeting the small additional burden imposed upon French productive power; and that the wisdom of the German law-makers in endeavoring to meet a much greater burden is vastly inferior to that of the law-makers of Great Britain, who more successfully dispose of a very much greater burden still.

It may be added that the uniformity that characterizes the fluctuations of the emigration of different nations to the United States confirms Mr. Giffen's conclusion that emigration depends not so much upon the state of affairs at home as upon prosperity or the reverse in the country of destination.

SOCIAL CONDITION OF THE PEOPLE.

The social condition of the people of this district is, in its general features, that of the people of England. The district contains its share of the upper classes, titled and untitled, and of the middle and lower classes. But, as would be anticipated from what has gone before, the predominance of the industrial and commercial interests tends to produce a condition of society more like that of our Eastern States—other sections, particularly in the south of England, presenting many features in common with the Southern States as they were before the late war.

Here, of all England, is to be seen the supreme effect of those extraordinary devices of economic legislation which have so changed in late years the relation which the income from trades and professions bears to that derived from lands, tenements, and titles, public dividends and annuities, Government offices and pensions. And Manchester, which, in the same period, has come to rank among the first cities in wealth and population, is the very embodiment of those forces which maintain this little island, against such odds, easily at the head of the world's commerce. As if to commemorate the triumph of these principles, the people have built them a great town hall at an expense of over \$5,000,000; and in this, perhaps the finest municipal building extant, the mayor of Manchester holds a sort of plutocratic court, more brilliant in some respects than that of some of the political capitals. Within the city are public buildings and private warehouses of huge proportions and great cost, and its wealth spreads out over the land for many miles around in the homes of its merchant princes.

LANDLORD AND TENANT.

The new Domesday Book, published in 1873, contains the following

The annual valuation rose from the amount stated above to £18,623,910 in 1885, or about \$90 per acre.

During the past quarter of a century the number of owners of land in Lancashire, and especially within this consular district, has very considerably increased. There is an extensively prevailing custom by which buyers of land purchase in fee-simple, but subject to the payment of a small rent (called a chief rent) to the original owner in perpetuity. This custom is peculiar to this part of England, the purchases in the south and other districts being affected by means of leases for long terms (usually 999 years), the fee-simple remaining in the original owner.

The purchaser under this latter system is to all intents and purposes the owner of the land, but his property is personalty and not realty, as is the case with the Lancashire purchaser. The importance of this distinction will be evident when it is remembered that the English law varies very considerably in relation to the two classes of property.

The purchase of small plots of land and the building of rows of workmen's cottages thereon has been a favorite form of investment with successful operatives and small capitalists. Large numbers of the dwellings of the working classes in the manufacturing towns are owned by their fellow-workmen or by small shop-keepers, working or retired; and the assistance afforded by land and building societies, large numbers of which have been formed, has contributed greatly to this result.

STATISTICS INDICATING THE SOCIAL CONDITION.

The figures of the census of 1881 indicate the urban character of this consular district, which then contained five towns of over 100,000 inhabitants; five of over 50,000, but less than 100,000; two of over 40,000; four of over 30,000; thirteen of over 20,000; and twenty of over 10,000. There were at the same time but twenty towns in all England containing over 100,000 inhabitants.

Taking the figures for Lancashire, which supplies nearly all the population of this district, and which will in its general features pretty accurately represent the district, I find that the average number of children attending school last year was 465,656, or 12 per cent. of the population at that time—the proportion for England and Wales being the same.

The number of paupers in Lancashire on January 1, 1886, was 77,287, or 2 per cent. of the population, the proportion for England and Wales being nearly 3 per cent.; the cost of their maintenance per head of the population was 52 cents, against 82 cents in England and Wales; and the proportion of such cost to the yearly ratable value of real estate was 2.08 per cent., against 3.8 per cent. in England and Wales in 1875, (the figures for the latter are not to be had for a later date.) The proportion of paupers would be smaller for this consular district, as distinguished from Lancashire. For example, Liverpool and Manchester show one pauper to 28 of the population, whereas in the large industrial town of Oldham it is but one to 63, and so on throughout the district.

Each acre in Lancashire supports nearly three persons—the density of population being four times as great as in England and Wales, and more than twice as great as in any other county outside of London itself.

The number of illegitimate children in Lancashire
the ten years, 1874 to 1883

1,000 marriages in 1880. In England 116 divorced persons were married in 1880; and the rate of such marriages to the total number of marriages was as 6 to 10,000. A statement of the present divorce law of this country is transmitted herewith.

Of the 192 verdicts of murder returned by coroners' juries in 1884, 163 were for infanticide, against 87 in 1883; 45 per cent. of the number for 1884 were returned in the county of Middlesex, which contains two-thirds of London. There was no verdict of this character in 1884 in Liverpool, and but 3 in Manchester.

The following comparative tables will further illustrate the several subjects to which they relate:

XXXVIII.—*Number of persons in chief Lancashire industries engaged in such industries in 1881 in England and Wales and in Lancashire.*

Industries.	England and Wales.*		Lancashire.†	
	Persons engaged.	Per cent. of population.	Persons engaged.	Per cent. of population.
Cotton	530,261	2	432,146	12
General laborers	559,769	2.16	74,050	2.15
Coal and mining	407,873	1.6	64,546	1.9
Iron and steel trade	361,343	1.4	55,728	1.6
Makers of machines	160,797	0.6	35,216	1

* Population, 1881, 25,974,439.

† Population, 1881, 3,485,819.

XXXIX.—*Houses and population of England and Wales and of Lancashire in 1881.*

Items.	England and Wales.	Lancashire.
Houses:		
Inhabited	4,831,519	655,307
Uninhabited	386,676	68,929
Building	46,414	5,697
Population:		
Males	12,639,902	1,669,864
Females	13,334,537	1,784,577
Total	25,974,439	*3,454,441

* This is the population of the county proper, as distinguished from the "registration county." The population of the latter, as chiefly used in this report, is, as will be seen, 31,378 greater. But the census uses the population of "registration counties," for records of occupation, &c., while it uses the population of the counties proper for records of the character here tabulated.

XL.—*Average number of persons to a family, persons to an inhabited house, families to an inhabited house, persons to a square mile, inhabited houses to a square mile, and acres to an*

Insane:	1,260	1,064
Idiots	1,993	1,572
Lunatics	3,253	2,636
Total		

* Census of 1881.

It may be observed that the census report points out the unmistakable general rule, so far as it can be judged from the returns, that agricultural districts produce a much larger proportion of idiots and imbeciles than industrial districts. The manner in which the returns are made, however, is referred to as rendering such returns of much less value than in the United States, where specialists were employed in making them.

XLVI.—Public schools, 1885.

Items.	England and Wales.	Lancashire.
Population, 1881	25,974,439	3,485,819
Number of schools	19,063	1,712
Number of children who can be accommodated	5,061,503	*630,571
Average number in attendance	3,406,076	465,656
Present at annual inspection	3,992,074	566,628

* Number on the register.

The cost per pupil in England, in the board schools, is £2 6s. 2½d. = \$11.22.

XLVII.—Statistics of crime in 1884.

Items.	England and Wales.	Lancashire.
Population, 1881	25,974,439	3,485,819
Committed for trial:		
Males	11,952	2,083
Females	2,455	703
Total	14,407	2,786
Convicted	11,134	2,242
Acquitted	3,220	540

XLVIII.—*Savings banks (not including postal savings banks), 1884.*

Political division.	Population, 1881.*	No. of banks.	Total amount invested with the commissioner for the reduction of the public debt.†	Total amount owing to depositors.	Amount of deposit per capita.	No. of receipts from depositors in year ending November, 1884.	No. of payments to depositors for same year.	Average amount of receipts.	Average amount of payments.	Average rate of interest paid to depositors.
England and Wales	25,974,439	329	\$171,855,726	\$172,498,382	\$6 64	1,376,264	839,854	\$21 52	\$37 27	\$13 25
Lancashire ...	3,485,819	21	32,695,316	32,777,433	9 40	439,675	262,581	19 16	29 40	13 33

* For purposes of comparison with the population in 1884, per capita, it may be noted that the rate of increase of population during the decennial period, 1871-'81, was 1.44 per cent. per annum for England and Wales, and 2.2 per cent. per annum for Lancashire.

† This represents the capital of the banks.

Besides the savings banks deposits, the last post-office savings bank return shows \$207,999,212.76 to the credit of open accounts in England and Wales on the 31st of December, 1885, of which \$14,335,682.16 was due Lancashire depositors. But the chief depositories of the Lancashire workingmen's savings are the co-operative companies, whose records are understood to show a very remarkable degree of prosperity on the part of the people of this district, and which, as further on intimated, will appear in a future report on the "co-operative movement" in Lancashire.

MANNER AND COST OF LIVING.

I am indebted to Mr. Samuel Andrew for the following account of the manner and cost of living of the average workingman of this district.

Housing.—The housing of the average workingman in Lancashire is good, cheap, healthy, and for the most part pleasant.

Passing through Lancashire towns on the railway one is struck with the long rows of dwellings built of brick or stone, according as brick or stone may be more plentiful or cheap in the neighborhood. These are the houses of the Lancashire workingman. They are generally four roomed tenements built two stories high, with back and front door, back yard, and conveniences at the rear. The two lower rooms consist of a living part (fronting a main street) some 15 feet square, communicating with a back kitchen some 15 feet by 12. The floors are flagged for the most part where the houses are not cellared, the stairs ascending from the back apartments. The living part is provided with fire-grate, oven, and boiler. The oven is adapted to general culinary purposes as well as for baking the household bread, for the quality of which the Lancashire house wife enjoys a high and well-merited reputation. The back room is used as a laundry and lavatory, being fitted up with boiler, slop stone, and small pantry. The sleeping apartments up stairs are, as a rule, fairly lofty and airy. The rental of such a house, modern built, would be 4s. to 4s. 6d. per week according to position and quality. Smaller cottages of an older type may be found ranging in rental from 2s. 6d. to 3s., but they are fast giving place to the better class described. These rentals generally cover all national taxations and for the most part the poor's rate, but as a rule the cottager contributes to local taxation for lighting, police, road repairs, school board, &c., at so much in the pound sterling on the annual rental.

man has been able to possess himself of a piano-forte and to give his children somewhat of a musical education in addition to the ordinary schooling. The ordinary Lancastrian has a great appreciation of music. Workmen's cottages, such as described above, of the better class cost £120 to £140 per cottage for erection, but in most cases a chief rent of 3d. to 4d. per yard per year is paid by the owner.

Eating.—The Lancashire workman is perhaps the best fed of his class in Great Britain. It is alleged that this is necessary to enable him to endure the hot temperature of the mills and workshops. Leaving home between 5 and 6 in the morning with a crust in his hand, he gets breakfast at 8 to 8.30, often at the mill, generally consisting of bread and butter, tea or coffee, sometimes with a couple of eggs or a rasher of ham or bacon. His dinner, 12.30 to 1.30, is a wholesome meal, almost always in part of meat and pudding or pie, his favorite dishes being a potato pie and a flesh pudding, which on working days form his alternate prandial meals, while on Sundays his dinner is of beef or mutton with pastry.

His third meal is generally his lightest, consisting of bread, butter, cheese, tea, salad, &c., while his supper consists of oatmeal porridge, milk, bread, jam, &c. He generally smokes or chews a vile strong tobacco called "twist," and drinks beer sometimes brewed from harmless herbs, but generally from malt and hops.

Since American beef and Australian mutton began to be so abundantly imported into England, the English workman has found more employment for his knife and fork. There was at first a conceit against foreign meat, but it is generally dying away. Good beef can be bought at 6d. to 8d. per pound, good mutton at 4d. to 7d. A preference is given to English-fed meat, and as a rule 2d. per pound more will be paid for beef and perhaps in some cases 3d. per pound more for mutton, than for foreign meats. American ham and bacon can be bought at 4d. to 7d. per pound, and American cheese at 4d. to 6d. The cost of living, on the style above mentioned, of an ordinary workman's family of five persons is said to be something less than 17s. to 18s. per week. The unskilled laborer with same family has sometimes to live on less than this cost; but perhaps he takes less meat and more tobacco, sometimes chewing and sometimes smoking.

Clothing.—The Lancashire workman in his holiday dress could hardly be distinguished from his employer, so far as dress goes. Clothing was perhaps never so cheap as at present. Huddersfield represents the manufacture of imitation woolen cloths, with a great mixture of shoddy and mungo, suitable for workmen's clothing. Ready-made men's suits can be had made up from these imitation cloths at any price between 18s. to 38s. and children's suits anywhere from 3s. to 18s. each. An excellent tweed suit can be bought fit for any man to wear at 50s. to 55s., and beautiful worsted or woolen suits of the best quality at £3 3s. to £4 4s.

Women's garments are as cheap in proportion, and the factory girls dress well when away from the factory, with a tendency to be a little loud. Moleskins and fustians are less used than they used to be as factory gear by the British workman, who as a rule adopts his cast-off Sunday clothes for the purpose. The wearing of clogs is still a great institution in Lancashire, as well in the interest of health as of cheap-

more than they did in 1870. The producing power of the operative has been increased by about 10 to 15 per cent., but he has an allowance for increased speed to the extent of one-half, and when it is considered that the machines have been increased in spindles and improved in structure it is doubtful whether he is not receiving more wages to-day than ever he did before. When the cost of provisions is taken into account, the position of the factory operative in full work is at least 20 per cent. better than it was in 1870.

This estimate refers to hands in full work. Many of those who have been thrown out of work have suffered severely. There is not much short time in the mills. The idea seems to prevail that it pays best for a mill to run full time or to stop altogether.

WEALTH AND THE LIBERAL ARTS.

While Lancashire contains 13.3 per cent. of the population of England and Wales, the latest tax returns to be had (1883-'84) show that it pays 14.1 per cent. of taxes. The difference, however, is much more striking when the returns for the profits of business and industry only are considered, in which Lancashire's share is 16 per cent. This will more fully appear from the following comparative table:

XLIX.—*Gross amount of property and profits assessed, 1883-'84.*

Sources of income, &c.	England and Wales.	Lancashire.
From the ownership land, tenements, and titles.....	£154,044,183	£18,706,453
From occupation of lands and tenements.....	44,780,800	1,857,443
From trades and professions.....	243,747,555	38,982,381
Tax, 5 <i>d.</i> in the pound.....	7,839,316	1,107,072

NOTE.—The incomes from public dividends and annuities and from Government offices and pensions are not applicable to statistics of the separate counties.

The difference would be even more striking if similar returns could be had for the Manchester district as distinguished from the county.

Very substantial people, therefore, are the Manchester men, as their general characteristics, no less than their income returns, demonstrate; yet they have not disdained those lighter accomplishments which follow in the train of wealth. In art,* architecture, music, and the drama they have pushed their city to the first rank in the Kingdom after London itself. What position they held in literature and science may be inferred from the establishment here, in 1880, upon the foundation of Owens College, of the only university in the north of England. This seat of higher education exercises academical jurisdiction over the "University College" of Liverpool, and will probably eventually extend over the "Yorkshire College" of Leeds. Naturally the first free library in England (1653) was established in Manchester, and the free libraries of the city (including Salfra) now contain 200,000 volumes. In the Owens College the department of physical sciences, under Sir H. E. Roscoe (president of the British association for next year), probably supplies the best instruction to be had in the United Kingdom in those branches of education which are the handmaids of industrial advancement.

* It is proper

IMPROVED CONDITION OF THE WORKING CLASSES

So much may be said for the greater folk. Under the same influences that have produced this vast wealth for the wealthy, the middle and the humbler classes have advanced to a degree of comfort never known by them before. Indeed there is not the same difference between the very rich and the lower classes which exists in many communities of the same wealth in our own country. The "line between the employing class and the employed" is perhaps "harder and sharper" than with us; but within the limits of this restriction, the great body of the people are more nearly on an equality than in similar communities in America, or, perhaps, it would be more exact to say that there is not so wide a social range as in such communities in America. Whatever may be the cause, the efforts of the laboring class to secure its share of the joint earnings of capital and labor, and of each class as against its superior in the social scale, so far as the capacity for earning a livelihood goes, seem to be more efficacious here than in similar communities in America.

So evident to a transatlantic visitor who takes the pains to look beneath the surface is the view I have expressed of this matter, that Prof. Goldwin Smith, on revisiting England the other day, was led to say, speaking of the whole country:

Nothing seems more certain than that the largest portion of the newly-made wealth has gone to the class which lives by wages, and that this class has suffered least by depression. Profits have fallen and wages have risen, as political economy, now so much despised, said that they would. Low profits and reduced rents to the people mean cheap clothing and cheap bread. Articles of popular consumption are very cheap, while the range of popular consumption is evidently growing larger. Economic laws have done, and are doing, what the labor agitator wants to do by industrial war. The thrifty artisan, so far as I can see, is just as well off here as he is in the United States, saving that the line is harder and sharper here between the employing class and the employed. That "the rich are always growing richer and the poor poorer" seems to be the reverse of the truth.

So, also, it is the rapid growth of population in the northern industrial centers which offers the one barrier to that sucking of the life of the provinces into London, which Lord Roseberry deplored, the other day, at Linlithgow. This industrial concentration, away from London, does not restore the English country life which Lord Roseberry lamented the decline of, but it gives many millions of toiling men and women better lives than otherwise would be possible for them.

The vast improvements constantly making in labor-saving machines, which have reduced the number of persons engaged in agriculture from 1,657,138 in 1871 to 1,383,184 in 1881, have imposed an additional burden upon the industries, already sufficiently taxed, one would think, in supplying employment for the increasing population. A like decrease has occurred in the numbers engaged in the shipping business, notwithstanding an enormous increase in the carrying capacity of its fleets, and this adds still further to the burden upon the remaining industries. "A workingman," discoursing upon last winter's distress among the laboring classes, recently wrote to one of the newspapers as follows:

When I said that economic forces are operating against the unskilled laborers, it is not that the rough work of the world is being put more and more upon the shoulders of the unskilled laborers, which is flowing

of cash-boys in large shops. These are only a few obvious instances. The same process is going on in the mines and factories. Society as a whole derives benefit from these changes, and skilled laborers derive a special benefit on account of the demand thus created for the labor they have to dispose of. But the employment of the unskilled laborers is taken from them, and their lot, already too hard, is made harder still.

Harder, without doubt, but harder only for the particular individual whom these appliances have displaced. Not harder for the class which he now ceases to represent, on the contrary, incomparably easier, as the statistics of paupers, who are the final residuum from the overcrowding of the ranks of the unskilled laborers, and whose fluctuating numbers measure the sufferings of this class, plainly show. As will be seen, the table given further on exhibits the percentage of pauperism for five periods since 1850, which has steadily declined from 5.11 per cent. in that year, to 3 per cent. on the 1st of January of the present year.

Without pursuing the subject further a notable illustration of what I mean, viz, that the forces, whatever they may be, that control the relations of capital and labor here favor the laborer more than such forces do in similar communities in our country is to be found in the extent and degree of success attained by the co-operative movement in this district. This is not short of astonishing; and in a future report I shall endeavor to make plain how much our workingmen have to learn in this respect from their more fortunate brethren here.

INCREASE OF LEISURE.

The people of all classes here enjoy much more leisure than the same classes with us; and notwithstanding the increasingly heavy odds at which the Lancashire laborer contends with those who live in newer countries, where the raw material upon which his own labor is expended is produced, and where pressure of population, the heaviest handicap upon wages in the industrial race, is entirely wanting, he scores a continued gain in this respect on his employer. Comparing the condition of the working classes, especially those of the Manchester district, with their condition forty years ago, Mr. Jacob Bright recently said that they now had practically two Sundays in the week, and a considerable portion of Saturday besides.

DECLINE OF INTEMPERANCE.

The Examiner and Times newspaper of this city abridges from the last report of the inland revenue commissioners the following tables:

L.—Consumption of wine, beer, and spirits, tea, coffee, and cocoa, per capita, in each of five years named, beginning with 1852.

Date.	British spirits.	Foreign and colonial spirits.	Foreign wines.	Beer.	Tea, per head.	Coffee, per head.	Cocoa, per head.
	<i>Gallons.</i>	<i>Gallons.</i>	<i>Gallons.</i>	<i>Barrels.</i>	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1852	.916	.177	.231	.608	1.909	1.207	.121
1862	.644	.177	.334	.661	2.694	1.178	.124
1872	.844	.285	.527	.885	4.010	.976	.245
1882	.809	.236	.406	.766	4.676	.885	.338
1885	.733	.221	.379	.746	5.022	.898	.402

It appears from 

EMIGRATION FROM EUROPE.

IMPROVEMENT IN MORALS AND DECREASE OF PAUPERISM.

The registrar-general's report for 1885 shows that in England and Wales a great and steady improvement is taking place in the percentage of illegitimate births. In 1845 they were 7 per cent.; in 1855, 6.4; in 1865, 6.2; in 1875, 4.8; and in 1884, 4.7—the last being the lowest figure ever known.

The following table is compiled, for the first four dates from Mr. Mulhall's tables, for the last from the registrar-general's report:

LI.—*Decline in pauperism since 1850 in England and Wales.*

Years.	Number of paupers.	Ratio to population.
		<i>Per cent.</i>
1850	921,000	4.11
1860	851,000	4.26
1870	1,079,000	4.69
1880	803,000	3.09
1886	813,000	3.00

LII.—*The decrease in the burden of pauperism from 1702 to 1880.*

[As shown in another of Mr. Mulhall's tables.]

Period.	Annual expenditure.	Per inhabitant.	National income.	Percentage of burden.
		<i>Pence.</i>		
1702-'14	£910,000	41	£65,000,000	1.40
1760-'75	1,520,000	58	122,000,000	1.24
1783-'93	2,050,000	66	145,000,000	1.41
1815-'20	7,106,000	152	220,000,000	3.23
1830-'35	6,742,000	114	385,000,000	1.75
1841-'50	5,250,000	74	490,000,000	1.07
1851-'60	5,510,000	69	580,000,000	.95
1861-'70	6,740,000	77	720,000,000	.94
1871-'80	7,710,000	75	935,000,000	.82

Not less marked was the increase in thrift among the laboring classes as indicated by the increase in the deposits in savings banks since 1830, as shown (for the United Kingdom) in the following table:

LIII.—*Deposits in savings banks from 1830 to 1881.*

Years.	Amount.	Per inhabitant.
1830	£12,600,000	\$4 38
1840	20,700,000	6 08
1850	27,680,000	7 30
1860	36,700,000	9 00
1870	46,230,000	9 73
1880	69,000,000	13 13

These give evidence of a steady decrease of crime, and recently of a greater proportionate decrease in the number of female criminals:

From the yearly reports relating to our convict prisons we are enabled to gauge with considerable accuracy the amount of crime that from one period to another is prevalent in the country, and it is certainly a matter of no small satisfaction to learn from the report just published that the number of sentences to penal servitude inflicted by the courts in England and Wales during the past year was 23 per cent. lower than in any previous year on record. This decrease in sentences for serious crime is, moreover, not of a temporary nature, owing to some transitory cause, but one that shows a continuous and progressive tendency.

During the five years ending in 1864, the average number of persons sentenced to penal servitude in the year was 2,800, and whilst these figures had dropped to 1,622 as the yearly average for the five years ending in 1874, a further diminution has reduced the average to 1,427 for the five years ending in 1884, and the actual number to 1,027 for the year ending in March, 1886; and this progressive decrease is all the more remarkable when we take into consideration that since 1864 the population has increased by over 7,000,000.

Another matter to which attention is directed in the report is that the decrease in the number of female criminals is in proportion larger than in the number of males. Of the total number of 1,027 males and females that received different sentences during the year, 708 were known to have never before been convicted; and on analyzing the crimes committed by these last we find, as in previous years, larceny and receiving stolen property still easily heads the list with a total of 219, followed by burglary, which accounts for 83 cases; rape, &c., with 74 cases, and wounding, shooting, &c., with 48.

During the twelve months there have been 25 murders, as against 38 in the previous year, and under the heading of robbery with violence the figures have dropped to 26 from 106 in 1884, and an average of 82 for the three previous years. The actual population in the prisons at the date of the last report is given as 8,396, of which number 821 were females, and of this total 3,344 were confined under sentences of five years.

Some curious statistics are given with a view to point out at what ages criminal propensities are most commonly developed, and from these we learn that while a far greater preponderance of criminals are to be found amongst males at ages varying from twenty-five to thirty-four, the female criminal does not become fully developed so early in life, and with that sex those at ages varying from thirty-five to forty-four easily bear off the palm of crime. To house our criminals twelve establishments were maintained during the past year, with a total staff of employes numbering 1,500. The gross total of expenditure in all these establishments amounted to £299,876, and by deducting from these figures the value of the convict labor (which was estimated at £164,271) and making allowance for some small sums obtained by the sale of old stores, &c., the net cost of our convict prisons last year amounted to £134,462.

The net charge per prisoner was, therefore, about £16 2s. 6d. Thus it appears that the expenses of convict establishments are very considerably reduced by the labors of the convicts themselves. For many years past a large number of convicts have been employed on Government works at Portland, Portsmouth, and Chatham, and now that these are completed, fresh employment has been found in making the harbor at Dover and on a new work for the war department at Luton, near Chatham. The number of soldiers, sailors, and marines at present in the convict prisons under sentences passed by courts-martial amounts to 126 and shows a great improvement over last year, when there were 200 and greater still over the previous year, when there were 350. The institution of the star class, in which are concentrated prisoners who are known to have never before been convicted, and not to belong to the criminal class, has been found, we are told, to work very satisfactorily; and so far as it has gone there is reason to think it is successful in its object of preventing prisoners who enter prison unversed in crime from coming under evil influences while serving out their sentences. It is, in conclusion, satisfactory to find that the Discharged Prisoners Aid Societies are doing good work, and in the past year we learn that out of the total number of 1,815 male prisoners liberated, 1,256 were taken in hand by one or other of these societies, and of the 254 women discharged 76 received assistance.

The report of the commissioners of prisons also shows that whereas there were 20,833 persons in

sons living on a square mile, yet it can scarcely make any difference, so far as health goes, whether in rural districts there be 2 acres or 3 acres on an average to each inhabitant.

The differences in the death rates in these sparse populations are determined by other conditions than aggregation.

There seem to be no natural causes for the comparatively high death rate in the case of Lancashire. The climate, taking it all in all, is healthy, the drainage good, the water supply abundant and pure, and the attention given by the authorities to sanitary matters generally, very great. I have no statistics upon which to base a comparison in this respect with the rest of England; but I should say, from the general character of municipal work in this district, and the large proportion of the district which is urban, that the people of Lancashire are at least as well cared for, in the matter of health, as any of their neighbors. The explanation must be sought, therefore, in the artificial conditions of life of the people. The density of population which, as has been pointed out, is twice as great as that of any other county outside of London, is, without doubt, one of the chief causes. But this does not account for all the difference, for London shows a lower death rate than either of the five districts enumerated above. These, however, are all industrial districts, and it would appear that there is something in the nature of the work done which tries the health in one way or another; for example, the muscular strain required in boiler and machine working; the dangers as well as the lung-destroying dusts of many kinds of mining and metal-working; the overheat of the weaving sheds and the cotton and mineral dust given off therein; the dense fog of steam in which the dyers, bleachers, and printers work; the noxious fumes from the great chimneys that fill the air.

Says Dr. Ogle:

The direct consequences of close aggregation are probably as nothing in comparison with its indirect consequences or concomitants. * * * Moreover, and perhaps more than all, it is in these crowded communities that almost all the most dangerous and unhealthy industries are carried on. It is not so much the aggregation itself, as these other factors which are associated with aggregation that produce the high mortality of our great towns or other thickly-populated areas.*

Speaking of the cotton industry, he says:

In the cotton factories the temperature of the weaving sheds is described in a recent report by Dr. Bridges to the home secretary as "tropical and relaxing," and dust, composed partly of filamentous particles of cotton and partly of mineral substances used for sizing, is stated to be a notable feature in most of the sheds.

In harmony with these facts, the statistics of the causes of death show that the deaths in Lancashire from phthisis and diseases of the respiratory system averaged, during the years 1870-'80, 30 per cent. of the deaths from all causes.

Applying Dr. Ogle's rules, viz, that the direct consequences of close aggregation are as nothing in comparison with its indirect concomitants, and that more than the direct and all the other indirect effects of aggregation combined are the dangerous and unhealthy industries which exist in such communities, it does not seem difficult to draw the general conclusion that it is a combination of the two causes, aggregation in its simpler form and aggregation as the forerunner and concomi-

*The indirect effects of aggregation omitted from this quotation and represented by asterisks, are "abject want, filth, crime, competition, and feverishness."

tant of dangerous and unhealthy industries, which produces the high death rate in London and in Lancashire; and that it is the greater death-causing power of that element which predominates in Lancashire (*viz*, the industrial) than that which predominates in London (*viz*, excessive aggregation leading to commercial rather than industrial development) which produces a higher death rate in sparser-settled Lancashire.

A new life table, based on the returns from 1871-'80, is given in Dr. Ogle's report, which shows the average expectation of life of a male English infant at birth to be 41.35 years, against 39.91 years by the old table (1838-'54) a gain of 1.44 years, or nearly a year and a half. For females the new table shows 44.62 years against 41.85 in the old, a gain of 2.77 years.

In his inaugural address at the opening of the sanitary congress at York, in September, Sir T. Spencer Wells, the president of the congress, said:

When they spoke of the prolongation of life, they thought chiefly of the advantage to individuals, their better health, and their augmented power of enjoyment. That was a great deal, but it meant more for the state. During the forty-nine years that registration had been in force, about 8,000,000 had been added to the population of the United Kingdom.

They would not be far away if they put the average duration of life in Great Britain before a century ago at about thirty years; now, according to the healthy life table, it was forty-nine years, and each individual of the 8,000,000 increase in the population was worth to the state £150; and if only 2,000,000 of the increased number was the fruit of sanitary and medical work, their economical value was at least a clear gain of £300,000,000 since the foundation of the sanitary institute.

INCREASED CONTENTMENT OF THE WORKING CLASSES.

After writing the foregoing portion of this report it occurred to me that the conclusions to which the facts and figures therein contained had irresistibly forced me, were so completely at variance with information hitherto furnished to the Department that I determined to test them by an appeal to eminent authority. I accordingly addressed identical notes to Sir J. C. Lee and Mr. Provand, M. P., containing a request for the favor of a reply to these two questions:

(1) In your opinion, do not the people of the Manchester district emigrate to a less extent than those of the rest of England in proportion to population? My investigations lead me to believe that such is the case.

(2) If so, is it not due, in your opinion, to the fact that such a large proportion of the population of the district is engaged in the cotton industry, and that the operatives in this industry are increasingly contented to remain at home because they are getting a larger share than formerly of the joint earnings of capital and labor?

Following are the replies of these gentlemen:

Sir J. C. Lee to Consul Hale.

56 MOSLEY STREET, Manchester, November 12, 1886.

DEAR MAJOR HALE: In reply to your note of the 9th instant, I have great pleasure in making the following statements, from which I think you will be able to deduce the information you desire.

I should class the various grades of labor in our community under five heads:

Per cent

10

Those in the first and second classes are in receipt of good wages, and rarely emigrate. Being good workmen they can obtain steady employment, have few taxes to pay, their house rent is very moderate, and their food exceptionally cheap.

Those in the third class, being younger men, are inclined to ramble, but not to a great extent, as they have all the advantages of their more skilled brethren, with the one exception that they cannot depend upon such steady employment.

The fourth class is the one that supplies the largest quota to the emigration returns, but so long as they can get employment they do not go away in large numbers, for the reason that their food and rent are cheap, and in hard times they can get assistance from the union and from private charity.

The fifth class does not emigrate. It consists of aged and impecunious persons—mostly paupers, many of whom eke out a living in a desultory way by a little occasional work, and are more or less chargeable to the union, when by idleness or want of thrift they are brought within a measurable distance of starvation.

As a whole the people of this district do not look upon emigration with favor, and I do not think we supply any large number of emigrants—certainly not in proportion to our population. The industries in the Manchester district are very varied, *e. g.*, cotton, iron, and chemical branches of trade, and there is always a good demand for good work people, who are in receipt of relatively higher average wages than has ever been known in my time.

Trusting that this brief expression of my opinion on this point may be of any use to you,

Believe me, very faithfully yours,

JOSEPH C. LEE.

Major HALE,
United States Consul, Manchester.

Mr. A. D. Provand, M. P., to Consul Hale.

38 LLOYD'S HOUSE, ALBERT SQUARE,
Manchester, November 12, 1886.

DEAR MR. HALE: On my return from London I received your note of the 9th instant. I have to reply to your two questions as follows:

(1) It is the case that the Lancashire people emigrate less than those of most of the other counties in England. So far from emigrating the increase of the population of Lancashire has for a long time past been added to by immigration, the increase as shown by census returns having been greater than would have been the natural increase. For the ten years ending 1881 the average increase throughout England (I am not now speaking of any other part of the United Kingdom) was 15 per cent., but the increase in Lancashire was 22½ per cent. West Yorkshire, which is also a manufacturing district, and contiguous to Lancashire, has likewise increased in population at a higher rate than would have been the case without immigration. The increase for the whole of Yorkshire has been 18½ per cent., but this has been chiefly in the western districts, and if the figures for this part of the county were separately obtained the increase of population would no doubt be as high, if not higher, than in Lancashire.

(2) The foregoing is due to the fact of the continued extension of the manufacturing industries in Lancashire during the past fifty years, and also to the fact that this extension has taken place away from the seaboard, for, notwithstanding that Liverpool is in Lancashire, almost the whole of the industries are carried as in the interior of the county. This prevents the growing up of maritime tastes, which lead to emigration. Another point to be noted is that the earnings of the cotton operatives are in some departments higher to-day than they ever were at any previous time, and in no departments are they less than they were. I use the word "earnings" and not wages because, although the nominal wages are less in many districts on account of the speeding of the machinery and other causes, the earnings, as I have said, are in some cases greater, and in all other cases as great as they have ever been.

I am yours faithfully,

A. D. PROVAND.

Maj. E. J. HALE,
Consul of the United States, Manchester.

It is not necessary

Sir J. C. Lee, who was knighted in 1882 for his eminent services in connection with the negotiations for renewal of the French treaty, is probably the highest authority on commercial matters in the Kingdom.

Mr. Provand is the very able member of Parliament whose opinion was sought (together with that of Sir J. C. Lee and some others) by the British foreign office, and embodied in the official memorandum on the subject of the character of consular reports, which the Department of State has recently issued for the information and guidance of the consuls of the United States.

CAUSES OF THE GROWING CONTENTMENT OF THE WORKING PEOPLE.

The shifting of the wealth of the nation, as indicated by the income-tax returns, more and more towards the industrial and commercial classes is not a less marked feature of the past forty years than the vast accumulation of wealth* itself which has taken place in those years. It is not possible also to determine from the returns what class of the beneficiaries just mentioned has received the greater proportionate share of the benefit. But the statistics and testimony here adduced tend to the conclusion that the advantage rests with the employed; and this conclusion, while probably true as to the whole country, is more certainly true as to this district.

The following tables, for the United Kingdom, extracted by Mr. Mulhall from the official "statistical abstract," throw further light upon the causes of the growing contentment of the people:

LV.—*Paupers.*

Year.	Number.	Per 1,000 inhabitants.
1850.....	1,308,000	48
1860.....	973,000	34
1870.....	1,279,000	41
1880.....	1,016,960	29
1885.....	982,000	27

LVI.—*Criminals.*

Years.	Committals per annum.	Per 1,000 inhabitants.
1850-'59.....	41,424	151
1860-'69.....	27,605	92
1870-'79.....	22,812	69
1880-'85.....	20,763	59

LVII.—*Children at school.*

Political division.	1875.	1885.	Per 1,000 inhabitants.	
			1875.	1885.
.....	1,863,200	3,371,300	76	123
.....			89	117

LVIII.—*Annual average of letters posted.*

Period.	Millions of letters.	Letters per inhabitant.
1841-'50	277	10
1851-'60	466	17
1861-'70	724	25
1871-'80	982	30
1881-'85	1,319	37

Compared with population, the number of letters last year was forty-three per head in England, thirty-two in Scotland, and eighteen in Ireland. During the past ten years the number of telegraphic messages has risen from twenty-one to thirty-nine millions, an increase of 86 per cent.

LIX.—*Bankruptcy.*

Period.	Number of bankrupts.	Amount.	Ratio of assets.
			<i>Per cent.</i>
1871-'76	8,038	£20,200,000	31
1877-'82	11,167	25,400,000	29
1883-'85	6,072	18,100,000	31

LX.—*Consumption of alcoholic-drink.*

Year.	Gallons per inhabitant.			Equivalent in alcohol.
	Beer.	Spirits.	Wine.	
1875	34.2	1.29	0.53	2.33
1881	28.6	1.08	0.44	1.92
1885	26.8	0.97	0.38	1.79

The consumption was 30 per cent. higher in 1875 than it is at present. It is still higher in England than in the sister kingdoms, the average of alcohol consumed being 1.90 in England, 1.67 in Scotland, and 1.23 in Ireland, per inhabitant.

LXI.—*Food.*

Articles.	1875.	1885.
Meat	95	106
Sugar	63	74
Tea	72	80

LXII.—*Thrift.*

	1875.	1885.
Savings banks		

The accumulations of the working class under the above two heads have averaged seven millions sterling per annum.

ASSISTED EMIGRATION.

Up to this point only that portion of the emigration from this country which proceeds voluntarily and without aid has been commented upon. The statistics given include, of course, all emigration; but my comments have been restricted, as just stated. As there is practically no deportation from the United Kingdom of chronic paupers, or insane or other helpless persons, it will be necessary now simply to consider the question of "assisted emigration."

It has been shown elsewhere that the laws of this country have succeeded for some forty years past in counteracting the motive to emigration in a steadily increasing degree, and that this has occurred notwithstanding the enormous increase of the motive, so far as it depends upon natural causes. But consummate as the Briton's economic genius has been shown to be, it has not yet been able quite to overcome its adversary's start. As soon as hard times increase the pressure of surplus population, attention is more earnestly directed to this cause of labor competition. The continued depression of trade, which existed, without serious check, up to a few months ago, redoubled the efforts of those who look to relief from emigration. The effect of these efforts, as made by those who were chiefly interested, whether from philanthropic or personal motives, in reducing the competition, may be thus stated:

There was a debate in the House of Lords on the subject of emigration to Canada, in March, 1884. Subsequently there was formed a "national association for promoting state-directed colonization," under high patronage and with a powerful executive committee. The national council connected with this association embraces the names of many representatives of several trades in various parts of the Kingdom, among them representatives from thirteen of the principal towns in this district. In March last a deputation from this association, headed by Lord Brabazon, its president, waited upon Earl Granville, then secretary of state for the colonies. And in April a debate ensued in the House of Lords, from the published accounts of which the following extracts will be interesting:

Debate in the House of Lords April 2, 1886.

"In the course of ten years, from 1871 to 1881," said the Earl of Harrowby, "about 3,250,000, or nearly the population of London, had been added to England and Wales alone, and since the last census nearly 1,500,000 more must have come into existence. There was every reason to fear that agriculture must provide less and less occupation every year. Between 1871 and 1881, 1,000,000 acres had been converted from arable to pasture, and in 1881 the number of proprietors and attendants on agricultural machines had increased to 4,200 from 2,100 in 1871. Then in 1861 there were 172 dwellers in towns to every 100 in the country, but in 1871 the proportion had risen to 192 and in 1881 to 212; and there was no reason to hope that the extension of small holdings and allotments, desirable as this was, could furnish anything like an effective counter-act that there was not yet apparent much suf-

exactly the same tale. The number of Scotch emigrants was 8,000 in 1877, 32,000 in 1882, and 21,000 in 1885, while the number of Irish emigrants was 22,000 in 1877, 105,000 in 1883, and 60,000 in 1885. The diminished number of emigrants last year might be accounted for partly by the state of the labor market abroad and in the colonies; but however that might be he contended that emigration had not afforded that relief which the state of our labor market required. The returns relating to net emigration were still worse than those to which he had just referred. Taking British and Irish emigration only, after deducting immigrants and emigrants, the numbers were 31,000 persons in 1877, 246,000 persons in 1883, and 122,000 persons in 1885. These were the numbers of persons who had been actually deducted from the labor market of this country. He feared that instead of voluntary emigration being in our hour of need a great resource, it was more and more ceasing to supply our need. This question had been brought forward on two occasions within the last twelve months. An important meeting was held at the Mansion House, and since then the noble earl who presided over the colonial office received in February an important deputation headed by Lord Brabazon. That deputation represented 170,000 workmen, and they made two requests. The first was for state-directed emigration, viz, state-planned new settlements with special arrangements, and state loans to enable settlers to go out. He believed that boards of guardians were now empowered to use the rates for emigration. But this was a very grave and serious matter, and he would like to know more about the details of it before he gave a decided opinion in favor of it. At all events the subject was clearly worthy of consideration. The second great point pressed upon the Government was that information should be given to every part of the country as to the colonial opening; that is to say, that the colonial office should get the best information together and forward it to many centers throughout the country. He believed a great deal of good would be done if that suggestion were acted upon."

The Earl of Idlesleigh said, "I hope that the inquiries we have heard of to be made by the colonial office, in conjunction with other departments, will not be limited to the prospects of workmen or emigrants going out of this country, but that they will lead to the furnishing of information likely to be useful, bringing before the manufacturers and people of the country the position and prospects of the colonies themselves."

THE EMIGRANTS' INFORMATION OFFICE.

The final result of the efforts described above was the establishment of an "emigrants' information office" in London, on the 11th of October. In the Guardian newspaper of this city there appeared, shortly before, a history of state-directed emigration from 1834 down to the establishment of the "information office," and a statement of the character and functions of the latter, as follows:

State interference in emigration began in the reign of William the Fourth, taking the form of an act "to empower His Majesty to erect South Australia into a British province or provinces, and to provide for the colonization and government thereof." The preamble recites that "divers of His Majesty's subjects possessing among them considerable property are desirous to embark," and that "it is highly expedient that His Majesty's said subjects should be enabled to carry their said laudable purpose into effect;" and the act provides that three or more "colonization commissioners for South Australia" shall be appointed to provide for the sale or letting of waste lands, and to apply all moneys so received to the purpose of an "emigration fund," to be employed "without any deduction whatever" (except for working expenses and colonial charges) in conveying "poor emigrants" from the United Kingdom to the colony. There is little doubt that considerable jobbery took place under this scheme, and a further development was forced on the Government six years later by the formation of the emigration board in 1840. This consisted of three commissioners with £1,000 each, whose expenditure was met by an imperial "emigration vote" of £1,000, supplemented by proportionate contributions from the proceeds of the sales of land in the several colonies. Reckless sales of land and an unwise policy of selection of "poor emigrants" shortly reduced the majority of the colonial land funds to so low an ebb that in 1843-'44 the tax-payers at home were called

on the colonial office vote for one of the clerks then transferred to that department "for emigration business." It is this gentleman who will have the chief share in the direction of the new office described below.

Since 1878 there has been an entire cessation of action on the part of the home Government in assisting emigration, whether pecuniarily or otherwise. Strangely enough, however, the establishment of the new "emigrants information office" was due to a movement started during the distress prevalent last winter with a view to obtain state help in furthering a great scheme of colonization. It is true that the National Association for State-directed Labor would indignantly repudiate any idea of state help, but after the interview of Lord Brabazon and his friends with Lord Granville at the colonial office in March last, the representative of the tax-payers could hardly share their views. Their scheme, briefly, was to establish a permanent colonization board under the colonial office, on which should serve, with other persons, the agent general of such colonial governments as should be disposed to co-operate. This board was to obtain grants of land from those colonial governments, and by loan from the Imperial Government to transport to such lands pioneer emigrants, at fixed wages, to prepare the soil for the advent of the detachments of selected emigrant colonists, who were to be located on 80-acre allotments, to be mortgaged to the colonization board for the expenditure to be incurred on behalf of the emigrants. In addition to transport, this expenditure was to cover furniture, implements, and maintenance, until the first harvest, plus administrative and pioneer expenses. The mortgage was to be repaid within a maximum period of ten years, with 4 per cent. interest. It was estimated that two millions sterling would be required in the first year. This scheme, so far as it was connected with the direction of emigration on the credit of the imperial exchequer, met with little sympathy from the government of the day, even though it had the support of Mr. Froude and Mr. Arnold White, and was painted in glowing colors alike by Mr. Alfred Simmons, the secretary to the Kent and Sussex Laborers' Union, and by Mr. Maudsley, representing the Manchester Trades Council. It was urged that there was no margin for possible failures, and there was neither a prospect that the colonies would contribute to the expenditure nor a certainty that they would allot the requisite lands to the proposed board.

On the other hand, it had long been felt by successive Governments that adequate measures were not being taken to spread among the working classes trustworthy information on the subject of emigration. Laborers anxious to emigrate were unable for the most part to obtain a simple statement of the prospects open to them even in a single colony, and there nowhere existed a systematic digest, periodically issued, of the comparative facilities for emigration and of the demand for labor in the several colonies. Whilst, therefore, a distinct objection was raised against pledging the credit of Great Britain in support of a scheme of state-directed emigration, Lord Granville readily adopted the idea of an "emigrants' information office." Considerable difficulty appears to have been experienced in overcoming the traditional reluctance of the treasury to incur new expenditure, but in the end the colonial office carried its point, and the treasury consented to find the money required for the new undertaking. The emigrant's information office thus originated is not a Government department. It is merely a subsidized institution having relations with the colonial office. It is managed by an unpaid committee of management, to be nominated by the secretary of state for the colonies, which will include gentlemen prominent in promoting emigration, together with representatives of the laboring classes.

The committee will be responsible for their expenditure, but they will receive £650 a year as a grant from votes of Parliament towards such expenses, together with franking privileges from the post-office for all correspondence, whether to or from their office. The stationery office will also undertake the committee's printing and supply all stationery free of charge. Taking all these items into consideration, the subsidy from public funds may roughly be estimated at £1,000 a year.

The functions of the emigrants information office will be to collect information through the agents-general from the various colonies, and to tabulate the returns obtained. The publications embodying this information will be of three kinds, to be revised quarterly or more often if requisite. In the first place there will be a general circular, which will be hung up in every post-office in the Kingdom, containing general information for intending emigrants to Canada and the Australasian and South African colonies. This will give succinct particulars of the full cost of passage at steamer rates to the colonies in question, together with the length of passage in each direction, and the cost of free and assisted passages will then appear, and the

request, as are farmers with some capital; whilst New South Wales makes a special appeal for navvies and men connected with the building trades. The general circular will conclude by giving the names and addresses of the colonial representatives in England to whom, or to the authorities of the emigrants' information office, application should be made for further particulars. In the second place there are special circulars, dealing in greater detail with the facts respecting each of the colonies referred to in the general circular. Each is divided into two parts, the first dealing with passages and the local demand for labor, and the second furnishing important particulars as to the climate, population, products, religion, education, cost of living, and land system. The two latter heads are fully treated, and will be worthy of general perusal by all interested in colonial matters, as well as by intending emigrants. The above two forms of circular will be issued gratis to applicants, but the moderate sum of a penny is chargeable for the third series of the committee's publications, styled "handbooks," in which fuller attention will be given to the points dealt with in the circulars. These handbooks will be procurable through booksellers in the usual way, or from the office direct. It is in contemplation, it is understood, to distribute the special circulars freely to all clubs and associations of the working classes, and to such philanthropic bodies as may seem likely to circulate them among those classes. At the head of each publication issued will be the notice that "the emigrants' information office has been established under the supervision of Her Majesty's Government for the purpose of supplying intending emigrants with useful and trustworthy information respecting emigration to the British colonies. The information issued by the office to the public is mainly obtained from the various colonial governments and their representatives in this country. No pains are spared to make the information as correct as possible, but the committee of management cannot undertake to hold themselves responsible for the absolute correctness of every detail.

* * * * *

With such unrivaled opportunities of information furnished to them by the two new departments, the wage-earning classes will be in a most favorable position to dispose of their labor to the best advantage; they will know where their services are in request, and there will be no longer any reason why ignorance concerning England's colonial possessions should place intending emigrants at the mercy of the sharks who have fattened on an earlier generation. The great difficulty experienced hitherto has been to select suitable emigrants. Of the unskilled and of ne'er-do-weels there has at all times been a supply far in excess of the colonial demand, but the men that a young colony needs to develop its resources must above all be practical—men acquainted with agriculture and handy with simple tools. For the skilled artisan also, especially if belonging to the building and allied trades, there is an increasing demand. The emigrants' information office should reach these men; and when we say men, it should not be forgotten that female emigration is more urgently needed than male.

There are some three-quarters of a million of women in the United Kingdom in excess of the total male population, but it is calculated that even this immense number would scarcely make up the opposite deficiency in the colonies. There is nothing, however, in the emigrants' information office which will justify any expectations of imperial contributions to the cost of emigration. It will be a center of imparting information and its functions will be strictly defined by its title.

ATTITUDE OF THE GOVERNMENT.

From what has gone before, it will be readily understood that the British Government favors emigration, but preferentially to its own colonies. The idea of "imperial federation," to which the display at the late Colonial Exposition gave impetus, accentuates the preference. Otherwise its attitude and the present state of the law on the subject of emigration, is set forth in a memorandum issued in September by the local government board, as follows:

Expenditure for emigration has, in the case of unions, become a common-fund charge, and where the guardians of a union expend money on emigration the written concurrence on the part of the guardian or guardians of any particular parish in the union is not required. Except in the case of orphan or deserted children under sixteen years of age, guardians of unions can expend

arate parish can expend money in the emigration of any poor person residing in such parish who is settled therein, or irremovable therefrom, whether in receipt of relief or not. They can also expend money in the emigration of orphan or deserted children who have no settlement, or the place of whose settlement is not known, provided they are chargeable. The local government board have no wish to discourage boards of guardians in the discretionary exercise of their powers of aiding the emigration of poor persons, providing due regard is had to the wishes of the colonies or of foreign countries, and such arrangements are made as are required for the welfare of the proposed emigrants. Strong objections have from time to time been urged on behalf of the colonies against the emigration from England of adult paupers. The colonists are unwilling to run the risk of thus receiving persons of bad character, or those who, from weak intellect or other causes, might become burdensome to them. As regards Canada, the board are informed that assisted passages are only given to farmers, farm laborers, and domestic servants. In consequence of representations which have been made by the Government of the United States, the board feel themselves precluded from sanctioning emigration to that country at the cost of the poor rates. The only cases in which the board consider themselves justified in departing from their general rule in this respect are those in which the emigrants are going to join a relative who is in a position to assist in maintaining them on their arrival, and who have given evidence of willingness and ability to do so by remitting the whole or a part of the passage-money. In cases of this kind the board are willing to consent to the payment of a small sum to cover the cost of conveyance to the port of embarkation, but in no such instance do they sanction the payment of any part of the passage-money or the cost of the outfit. It may be mentioned that, under an act of Congress passed in 1882, passengers arriving in the United States are required to be examined, and if on such examination there is found to be any person unable to take care of himself without becoming a public charge he is not permitted to land. The board are in communication with the Canadian Government with regard to the inspection of orphan and deserted children sent out to the dominion by boards of guardians, and pending the receipt of reports on such inspections, the board are not sanctioning the emigration of orphan and deserted children to Canada. Before deciding to issue an order authorizing expenditure in respect of any proposed emigration, the board require to be furnished with a copy of the resolution of the guardians and with a list and description of the persons desirous of emigrating.

The statistics of emigration are obtained by the Government chiefly from the records of the ship-masters of such vessels as come under the "passengers acts," (section 4, act of 1855, and section 4, act of 1863). The records are prepared in accordance with sections 16 and 17 of the act of 1855, as amended by section 6 of the act of 1863. Copies of these acts, which, as will be seen, contain very complete regulations for the comfort and safety of emigrants, will be found herewith.

SPECIAL PRIVILEGES OR RATES OF FARE.

Emigration from the United Kingdom to other countries than the United States and the British possessions is so insignificant in extent that this division of the subject may be confined to considering the special privileges and rates of fare offered by the latter. There was published in 1877 an official statement—"No. 34, Colonization Circular"—which contained a digest "of nearly all the statutes of states and colonies with which the emigration of the United Kingdom is related," but I have failed to find any one who possessed a copy, and Mr. Giffen writes me that "the board [of trade] regrets that they are unable to supply [me] with a copy of the colonization circular referred to, every effort has been without success." By the

This information will be found in circulars Nos. 1 to 10, inclosed herewith.

DIGEST OF EMIGRATION—OFFICE CIRCULARS.

The following is an abridgement of the information contained in the circulars :

The time ordinarily taken on voyage, and the lowest rate of unassisted passages to Canada and the Australasian and South African colonies, is as follows :

LXIII.—Length and cost of passage.

Colonies.	By steamer.		By sailing vessel.	
	Average time.	Lowest fare.	Average time.	Lowest fare.
	<i>Days.</i>	<i>£ s. d.</i>		<i>£ s. d.</i>
Canada	10	4 0 0		
New South Wales	52	16 16 0	About 3 months.	13 13 0
Victoria	49	16 16 0	Nearly 3 months.	13 13 0
South Australia	42	16 16 0	do	13 13 0
Queensland	55	17 0 0	About 3 months.	13 13 0

* Second-class.

PASSAGES.

Free passages.—The only colony to which free passages are given at the present time is Queensland, and the system in that colony applies only to single female domestic servants and to agricultural laborers.

Assisted passages, Canada.—Assisted passages cost £3 to each adult—the system applies only to agriculturists, farm laborers, and their families, and to female domestic servants.

Western Australia.—Assisted passages cost £4 to each adult—the system applies mainly to farmers and agriculturists, and a deposit of £100 (to be refunded on arrival in the colony) is required before any assistance is given.

New Zealand.—Assisted passages cost £10 to each adult—the system applies only to farmers and agriculturists with small capital. Before any one of this class receives such assistance he must show that he is possessed of £100, and an additional £50 for each member of his family over 12 years of age.

No assisted passages are given at the present time to New South Wales, Victoria, South Australia, Queensland, Tasmania, or Natal; and in the case of the Cape they are given only to certain emigrants under contract with employers in colony.

Nominated passages.—Queensland
New Zealand

Passages at low rates are also provided for laborers engaged by Queensland employers for a term of years (for particulars see circular relating to Queensland).

Western Australia.—Without payment, to a limited number of nominees, approved by the Crown agents for the colonies.

Tasmania.—Adult males, not over 40 years of age, £5; females, not above 40 years of age, £5; married couples, not above 45, £6.

New Zealand.—Over 12 years of age, £10. As a rule, confined to agricultural laborers and female domestic servants.

No nominated passages are at present given to Canada, New South Wales, Victoria, South Australia, the Cape, or Natal.

ARRANGEMENTS ON LANDING.

Canada.—Temporary houses or stations for emigrants are provided at the ports of Quebec and Halifax and the other principal towns in the Dominion, and the arrangements made are very complete.

New South Wales.—At times when assisted passages are granted by the colonial government, a home is opened at Sydney for the temporary reception of government-assisted female domestic servants on first landing.

Queensland.—There are stations at the principal ports and in various parts of the colony in which government-assisted emigrants are received free of charge for a few days after arrival.

Western Australia.—There is a station at Fremantle for the reception of government-assisted emigrants.

New Zealand.—There is a station at every principal port for the reception of government-assisted emigrants.

None at present in Victoria, South Australia, Tasmania, the Cape, or Natal.

BEST TIME OF ARRIVAL.

Canada.—April to June (for agricultural laborers); not the winter months.

New South Wales.—Any month; September for preference.

Victoria.—Any month; September for preference.

South Australia.—May to October.

Queensland.—April to October, inclusive.

Western Australia.—September.

Tasmania.—October.

New Zealand.—October to February, inclusive.

Cape.—About July (for agricultural laborers).

Natal.—Any month; August for preference.

PRESENT DEMAND FOR LABOR.

Canada.—There is an opening for tenant farmers with capital, for male and female farm servants, and for female domestic servants.

There is some opening for persons connected with and for fe-

Little or no demand in Victoria, South Australia, New Zealand, the Cape, and Natal, except for female domestic servants.

In all the colonies there is an opening for farmers with capital.

EFFECT UPON EMIGRATION TO THE UNITED STATES.

I am not disposed to think that the special privileges or rates of fare now offered, or which have been offered, by the colonies, materially affect emigration from this country to the United States, except that portion which is contributed by the agricultural classes. Under the heading "the dispersed abroad," the large emigration from Canada to the United States of persons of British origin who had first emigrated to Canada, was noticed. How many of these, if any, may have received assistance in the first instance from the Canadian Government or corporations, there is probably no means of knowing. The juxtaposition of the two countries and the large numbers of recently arrived emigrants, who pass over the border from Canada into the United States, make it necessary, as will have been observed, to consider many questions of emigration from the common standpoint of the two countries. No material error results from this, both because the main features of emigration to the two countries coincide and because the emigration to Canada is so small in comparison with that to the United States that any variation in detail would produce an insignificant effect upon the general result. With Australasia the case is different. It will be remembered that Mr. Giffen's conclusions, as quoted in the first division of this report, which seem to be altogether justified by the statistics, are to the effect that emigration to Australasia "varies not quite in accordance with the emigration to the United States, and appears to be less exclusively determined by natural causes." I have sought to follow out this idea and to ascertain the cause of the difference noted, in a more particular way, as a method likely to disclose also the measure of the effect upon emigration to the United States of the special privileges offered by other governments—chiefly those of the Australasian colonies. By selecting from Mr. Giffen's tables of occupations from 1877 to 1885 the two classes of agriculturists therein distinguished, and comparing them for the United States, Canada, and Australasia, with the number of "general laborers," and with the total number of male adults emigrating to those countries for a series of years, a very fair idea may be had of the disturbing effect of the causes now under consideration.

The subjoined tables seem to show very plainly in what direction the effect is felt.

LXIV.—*Table showing the total number of male adult emigrants of British origin, and the numbers of several classes of such emigrants, who left the United Kingdom for the United States, British North America, and Australasia, respectively, in each of the nine years from 1877 (the first year in which nationalities and occupations were both distinguished) to 1885, and the average number per annum of each such class during that period.*

[U. S. is used to designate the United States; B. A., British North America; A., Australasia and all other places, "all other places" including the East Indies, British West Indies, Cape of Good Hope, and Natal, and Central and South America. The numbers for all these, however, are small compared with that for Australasia, under which general head it is convenient to classify them.]

Year.	Description.	U. S.	B. A.	A.
1877	Agricultural laborers, gardeners, carters, &c Farmers and graziers			

EMIGRATION FROM EUROPE.

LXIV.—Table showing the total number of male adult emigrants, &c.—Continued.

Year.	Description.	U. S.	B. A.	A.
1878	Agricultural laborers, gardeners, carters, &c	96	65	5,936
	Farmers and graziers	2,008	221	1,067
	Total agricultural class	2,104	286	7,003
	General laborers	8,960	1,828	2,913
	Total male adults	28,114	5,977	24,761
1879	Agricultural laborers, gardeners, carters, &c	144	32	3,923
	Farmers and graziers	3,186	256	1,940
	Total agricultural class	3,330	288	5,863
	General laborers	18,584	6,261	3,659
	Total male adults	48,552	10,666	28,583
1880	Agricultural laborers, gardeners, carters, &c	1,007	1,214	1,700
	Farmers and graziers	5,596	428	1,188
	Total agricultural class	6,603	1,642	2,888
	General laborers	42,865	5,085	2,114
	Total male adults	80,475	11,579	20,459
1881	Agricultural laborers, gardeners, carters, &c	336	169	2,168
	Farmers and graziers	3,186	274	714
	Total agricultural class	3,522	443	2,882
	General laborers	50,164	8,115	1,544
	Total male adults	86,239	13,244	23,185
1882	Agricultural laborers, gardeners, carters, &c	312	322	4,504
	Farmers and graziers	3,564	505	797
	Total agricultural class	3,876	827	5,301
	General laborers	52,103	15,413	2,216
	Total male adults	88,233	21,877	29,133
1883	Agricultural laborers, gardeners, carters, &c	190	495	7,409
	Farmers and graziers	4,363	433	1,462
	Total agricultural class	4,553	928	8,871
	General laborers	50,636	16,053	4,145
	Total male adults	88,995	21,534	40,465
1884	Agricultural laborers, gardeners, carters, &c	5,871	355	2,886
	Farmers and graziers	3,023	553	1,550
	Total agricultural class	8,894	908	4,536
	General laborers	33,002	11,086	3,226
	Total male adults	73,498	16,251	28,029
1885	Agricultural laborers, gardeners, carters, &c	5,450	351	3,286
	Farmers and graziers	3,518	285	1,420
	Total agricultural class	8,968	636	4,706
	General laborers	25,506	4,144	3,157
	Total male adults	67,465	10,616	26,140
AVERAGE.		1,496	335	3,992
	Agricultural laborers, gardeners, carters, &c	3,318	344	1,228
	Farmers and graziers	4,814	679	5,220
	Total agricultural class	32,123	7,656	2,820
	General laborers	64,929	12,875	26,992
	Total male adults			

From the foregoing table another may be constructed which will more completely define the difference between the emigration to North America and that to Australasia, and serve to measure the effect of the causes which produce that difference, as follows:

LXV.—Table showing the proportions which the “agricultural laborers,” the “farmers and graziers,” the “total agricultural class,” and the “general laborers,” severally constitute of the total British male adult emigration to the United States, to British North America, and to Australasia and “other places,” respectively, as averaged during the nine years from 1877 to 1885.

Items.	Destination.		
	United States.	British North America.	Australasia and other places.
Total number of male adults.....	64,929	12,875	26,992
Agricultural laborers, &c.....	1,496	335	3,992
Per cent. of total.....	2.3	2.6	14.8
Farmers and graziers.....	3,318	344	1,228
Per cent. of total.....	5.1	2.7	4.5
Total agricultural class.....	4,814	679	5,220
Per cent. of total.....	7.4	5.3	19.3
General laborers.....	32,123	7,656	2,820
Per cent. of total.....	49.5	59.5	10.4

It thus appears that agricultural laborers constitute only a small portion of the male adult emigration to the United States and Canada, being but about $2\frac{1}{2}$ per cent. of the total; whereas the emigration of the same class to Australasia reaches the large figure of nearly 15 per cent. But in the case of a better class, farmers and graziers, the proportions are quite different, being 5 per cent. for the United States, $2\frac{1}{2}$ per cent. for Canada, and $4\frac{1}{2}$ per cent. for Australasia. But if we combine all agriculturists under one head the proportions are 7 per cent. for the United States, 5 per cent. for Canada, and 19 per cent. for Australasia. The general laborers, on the other hand, show a very great preference for North America, constituting 60 per cent. of all the adult male emigration to Canada, and 50 per cent. of that to the United States, while they contribute but 10 per cent. of such emigration to Australasia.

These figures, then, show a very marked difference between the character of the emigration to the United States and that to Australasia, in certain important particulars. By turning to the circulars of the information office it will be seen that there is a more uniform demand in Australasia for farm laborers than for other classes of emigrants, and, as these get good wages there, ranging from \$200 to \$375 per annum, in addition to board and lodging, it would be reasonable to suppose that they would be largely induced to emigrate by assisted or “nominated” passages. The statistics are therefore in harmony with what might be expected.

During the years when free passages or assisted passages were most easily had it would be reasonable also to expect this class to contribute in an unusual degree to the volume of emigration to the countries offering them. I have not been able to procure reliable or complete information concerning such privileges during a series of years, but a comparison of these with the fluctuations in the emigration would doubtless

CONCLUSION.

The information gathered under the foregoing seven titles of this report has been freely commented upon as the instructions of the Department seemed to justify or require. It will hardly have escaped notice, however, that there is a class of facts running through the whole, which point with such persistence in one direction, as to require a more serious and comprehensive consideration.

The question of the wages of laborers on the one hand, and of the amount of the necessities and comforts of life which those wages can purchase, on the other, has long commanded the attention of economic writers, who seem by such a comparison to measure the relative advantages conferred by the laws of different nations upon the earners of wages within their respective domains. Without doubt, in the absence of a more comprehensive guide, these factors are of great value in the solution of the problem. There is no difficulty in bringing the currencies in which wages in different countries are paid to a common standard, and the efforts referred to then proceed upon the assumption that it only the cost of the articles for which the wages are expended can be ascertained, the other factor becomes determinate, and consequently the value of the wages determinable. This, however, by no means ends the difficulty, for the different conditions under which wage-earners work in different countries, difference in the number of hours of labor per week, difference in the machinery and the speeding of machinery, difference in the kind of housing, clothing, and food which supplies the greatest amount of comfort under the varying conditions of climate and other peculiarities of the places where their several lots are cast, so complicate the terms of this factor that the writers referred to are never able to write in the same language. The confusion is not less real because frequently it is not perceived that the language is not the same. On the contrary a much more perfect synonymy than is yet within reach is needed to reconcile the barbarous voices in which the laborers in widely separated countries describe what satisfies them in meat and drink, clothing and shelter, leisure and enjoyment. So it comes about that we are constantly multiplying oranges by apples, and never cease to quarrel over which kind of fruit rewards the effort.

It has been said that the ablest commissary-general who ever lived could not feed London for a day; yet the law of supply and demand, operating through the forces of individual self-interest, directed by no concert of action, but following the rut and concentrated in their final effect, delivers to the great city each day just what it needs of corn and meat and drink. By an unerring law of like kind the laborer who is able to avail himself of the opportunity to sell his labor in the market of the world, sells it where his wit, quickened by the first law of nature, tells him he can get most for it.

It seems to me that the decision of many hundreds of thousands of such people, as arrived at by considering their action through long periods of time, and by a comparison of their action in different periods of time, and by a comparison of their action in different periods of time, and by a comparison of their action in different periods of time, is not only

It is proposed, therefore, to recapitulate what, we have seen, the emigrant laborer has been doing with himself, and to come to the conclusion that he has come to.

We have seen, in the first place, that there is a law of emigration which regulates the flow of emigrants—not in accordance with the state of trade in the countries whence the emigration proceeds, but in accordance with the state of trade and of the labor market in the countries to which it is destined. We have seen that the volume of emigration rises and falls, in response to the changes of condition just stated, with singular regularity; and that such rise and fall is coincident in the two countries, the United Kingdom and Germany, which chiefly supply emigration to the United States.

We have seen, in the second place, that it is the unskilled laborers who supply the chief portion of emigration; that the increasing pressure of population seeks to relieve itself by throwing off those of this class who are least able, within the limit of ability, to transport themselves, to resist the intense competition which results from such pressure; and that these, obeying the law of supply and demand, strike a balance for themselves between competition at home and that which the last resort of emigration subjects them to in the countries to which they might emigrate. We have seen, in the third place, that the United States, directly and indirectly through Canada, absorb nearly all of the unskilled laborers thrown off in the process just described; and that, while all grades of laborers are admitted to the United States duty free, only, or almost only, those take advantage of this exemption who are furthest removed by want of skill from ability to work in the industries which do not enjoy a like exemption.

We have seen, in the fourth place, that as soon as facility of transit between 1840 and 1860 opened the way to relief from pressure of population, the British and the Germans, whose population rapidly increases, instantly availed themselves of the opportunity of relief thus afforded, by increasing their ratios of emigration at a bound—the British by 500 per cent., the Germans by 600 per cent.

And we have seen, in the fifth place, that notwithstanding both the pressure of population and the facility of transit for relief of such pressure enormously increased in the United Kingdom and in Germany between 1860 and 1880, the ratio of emigration to the United States to population fell off in each country during that period; but that it fell off 23 per cent. in the United Kingdom and only 6 per cent. in Germany, notwithstanding the intensity of the pressure became greater in the former country than in the latter.

In a word, it appears that the United States have not presented the same attractions to the class that lives by wages since 1860 that they did before that time, and that the wage-earner has governed himself accordingly.

In harmony with these facts we have also seen that during the past forty years the wealth of the people of the United Kingdom has vastly increased, and that, in the process, that portion of the population which lives by trades and professions has gotten the lion's share of the increase; that of this class the employed have been especially

enjoyment of better food, housing, and clothing, and these as the result of higher wages; in better health and longer life; and, while lighter burdened by taxes than any other of the civilized nations, in gaining more leisure and securing a greater increase of the benefits of diffused education than the people of any other portion of the world; and, finally, that these changes, as a rule, have taken place in greater degree in the Manchester district—which, as the chief center of industrial development, has also to provide for the greatest increase of population—than in the rest of the Kingdom.

From all which it is to be concluded that the British workingman has not ignored the law of supply and demand, which governs all other such transactions, nor rebelled against his own interest in choosing the market for his labor. With such precision, indeed, has he seemed to adjust his movements to the fluctuations of the labor market as to suggest that he is guided by a price-current like his more learned brother in commerce. Perhaps the price-current exists, though it may not come to him in the tabulated form which serves the merchant so well.

Among Mr. Giffen's tables—which are a mine of wealth to the industrious searcher therein—is one which has been continued since 1848, showing the amount, so far as ascertained, of money remitted by settlers in the United States and Canada to their friends in this country. A comparison of these remittances during the period in which the British workingman has been showing an increasing aversion to the United States, with so much as the record admits of of the period which seemed so attractive to his emigration, would appear to supply such a price-current; and one which, it will be seen, singularly confirms the correctness of the ruder information that he must have acted upon.

Statement extracted from Mr. Giffen's Table VII and XII of the number of British subjects emigrating from the United Kingdom to the United States and British North America from 1853 (before which year the nationalities were not distinguished) to 1880; of the total amount remitted by settlers in those two countries to their friends in the United Kingdom in each year and in certain groups of years, and of the amount per capita in each such year and group of years—calculated in sterling and in its equivalent in United States gold coin.

Years.	Number of emigrants.	Amount remitted.	
		Total.	Per capita.
			£. s. d.

Statement extracted from Mr. Giffen's Table VII and XII of the number of British subjects emigrating from the United Kingdom to the United States, &c.—Continued.

Years.	Number of emigrants.	Amount remitted.		
		Total.	Per capita.	
			£. s. d.	
1871.....	175,742	£702,488	4 8 0	\$21 40
1872.....	186,164	749,664	4 0 7	19 60
1873.....	195,775	724,040	3 13 9	17 94
1874.....	134,502	485,566	3 12 2	17 56
1875.....	93,499	354,356	3 15 9	18 43
1876.....	63,889	449,641	7 0 10	34 26
1877.....	53,201	667,564	12 11 0	61 06
1878.....	65,346	784,067	11 19 10	58 34
1879.....	109,758	855,631	7 16 0	37 95
1880.....	187,472	1,403,341	7 9 9	36 43
1871 to 1880	1,265,348	7,176,358	5 13 5	27 59
1861 to 1880	2,528,284	12,046,399	4 15 3	24 17

It thus appears that from 1853, the first year of recorded nationalities, to 1860, inclusive, 929,004 emigrants to the United States and British North America sent back savings amounting to £7,113,270, or \$37.24 per capita, and that from 1861 to 1880, inclusive, 2,528,284 emigrants sent back savings amounting to £12,046,399, or \$24.17 per capita. An examination of the table more in detail would tend to heighten the contrast, especially when the difference in the value of money between the two periods is considered, and the further fact that whatever incompleteness exists in the records would be constantly diminishing as we approach the present time.

Taking all these things into consideration, the conclusion would seem to be irresistible that, while this country has been making such extraordinary progress in wealth and all that brings contentment in life, my own country has been standing still or retrograding. But upon turning to the statistics of the United States I find, on the contrary, that our wealth as a nation has enormously increased during the very period in which the British workingman has been showing his strange aversion to us.

Perhaps, however, the increase of wealth has not been undergoing diffusion, as here in the United Kingdom, and that it has gone into other hands than the like of his. His conduct and Mr. Giffen's tables would indicate that such is the fact.

As already remarked, such information has been collected in this report and such comments made upon it as the Department's instructions seemed to justify or require. I do not understand that I am called upon to attempt an explanation of the causes which have brought about a state of affairs so humiliating to our pride as that in this so-called aristocratic country wealth is measurably passing from the few to the many, while in our own country, during the last quarter of a century, a movement of quite a contrary kind seems to have been occurring. That, I assume, will be the care of those who give attention to economic questions with a view to affecting legislation, and who, following the spirit of our institutions, concern themselves with the man.

EMIGRATION FROM EUROPE.

NOTE.—It may be observed that in the note at the foot of Table VIIa, page — of this report, Mr. Giffen calls attention to the necessary incompleteness of these records. In a former report he also called attention to certain deficiencies that would render a conclusion drawn from a comparison between particular years misleading, as, for example, a certain amount which should have appeared in a given year was not returned until the next, &c.; but error from this source is avoided by the aggregation of numbers of years, and the measure of incompleteness, as already explained, cannot be variable except in an increasing tendency to greater fullness as the present time is approached. It may also be added that it would appear from this table that the emigrants have sent back something more than the amount which Mr. Wilson, of the Inman line, informs me they carry away, viz, £5 (about \$25) on an average.

EXPLANATION OF MAP OF CONSULAR DISTRICT OF MANCHESTER.

Upon an English ordnance map circles were described about Manchester and the neighboring seats of United States consuls in radii of multiples of 4 miles. Where the lines of circles of equal radii met between Manchester and the other consulates to the law defining the "place of shipment," and was almost conterminous with this consular district as it has existed in years of practice. The map now inclosed was constructed from the map just described by adding a little of the cotton portion of Yorkshire and yielding a little of the wool portion of Bradford, as in trade and practice would be required.

Again, Warrington is just within the Manchester boundary, but its population has not been included in the estimate of population for this district, because Liverpool has long been the market town of Warrington, and there Warrington's invoices are certified.

NOTE ON THE LAW OF DIVORCE.

Previous to the year 1857 all matrimonial suits came before the ecclesiastical courts. But a divorce could only be obtained by means of a private act of Parliament, the expense and trouble of obtaining which made divorce a luxury of the opulent. By the act 20 and 21 Vict., c. 85, there was established a civil court, entitled the court of divorce and matrimonial causes, since absorbed into the probate, divorce, and admiralty division of the high court of justice. The act provides that a petition for dissolution of marriage may be lawfully presented to this court by the husband on the ground that his wife has been guilty of adultery; by the wife on the ground that her husband has been guilty of incestuous adultery, bigamy with adultery, rape, unnatural crime, or of adultery coupled either with such cruelty as would by itself entitle her to a judicial separation, or with desertion for two years or upwards. If the husband be petitioner, he must, unless specially excused by the court from so doing, make the alleged adulterer a co-respondent. The petitioner, whether husband or wife, must prove that there has been no collusion on his or her part. The husband may, in a petition for dissolution of marriage, claim damages from the adulterer, and the court has power to direct in what manner the damages given should be applied. It may also order the adulterer to pay the costs of the proceedings, in whole or in part. The court may order the husband to provide for the wife, by securing to her either a gross sum or an annual allowance or monthly or weekly payments, and may make his doing so a condition of its decree. It may also make such orders with respect to the custody of the children of the dissolved marriage, and with reference to any property secured by settlements made before or after such marriage, as it may think proper. A decree for a divorce is always in the first instance a decree *nisi*, and cannot be made absolute until three months have elapsed from the time of pronouncing it. During this period any person is at liberty, in the proper manner, to show cause why it should not be made absolute, or to give information to the Queen's proctor of any fact material to the case. The Queen's proctor thus informed, and having reason to suspect that the parties to the suit have been acting in collusion, may, under the direction of the attorney-general and by leave of the court, intervene in the suit. Either of them, may insist on having the contested matters of fact and the husband must always be assessed

TUNSTALL.

REPORT OF CONSUL SCHOENHOF.

Emigration from the United Kingdom finds its high tide usually in the years of greatest business activity in the United States, and conversely its lowest ebb in years of business stagnation ruling in the States. Likewise is the back-current influenced, moderated, or intensified by the same causes, and the flow of immigrants to the mother country is heaviest in years of depression, when trade and manufacture is equally stagnant in Great Britain as well as in other countries the world over. This is evident from the following tables, covering sixteen years for emigration and ten years for immigration, the period for which separate lists of immigrants of British and Irish origin were kept.

A—Balance of emigration of persons of British and Irish origin only, deducting recorded immigration from recorded emigration of such persons.

[From the board of trade returns.]

† Business activity.

That this centripetal and centrifugal force is mainly exercised by the United States is shown by the Tables B and C below. B giving the countries to which emigration was directed and C the countries from which immigrants returned during the same period of years to the mother country.

EMIGRATION FROM EUROPE.

B.—Number and percentage of persons of British and Irish origin only, who left the United Kingdom for the United States, British North America, Australasia, and all other places, in each year from 1870 to 1885, inclusive.

C.—Number of British and Irish immigrants from various countries landed in the United Kingdom in each year since 1876, the first year in which the nationality of the immigrants was recorded.

Year.	From United States.	From British North America.	From Australasia.	From all other places.	Total.
1876	54,697	6,629	2,579	7,499	71,404
1877	44,878	5,687	4,637	8,688	63,890
1878	34,040	6,004	4,207	10,493	54,944
1879	20,048	3,497	4,967	9,424	37,936
1880	26,518	4,688	5,910	9,891	47,007
1881	29,781	5,761	5,877	11,288	52,707
1882	28,468	6,097	6,871	13,275	54,711
1883	46,703	7,021	6,844	13,236	73,804
1884	61,466	8,861	8,312	12,717	91,356
1885	57,604	9,321	7,946	10,597	85,468

Years of business activity in the United States, being the greatest percentage of emigrants to that country and the smallest number to Australasia, while in years of stagnation the reverse is noticeable. We observe the same fact in the emigration statistics of the anterior decade, from 1861 to 1870.

D.—*Number and percentage of British and Irish origin only who left the United Kingdom for the United States and Australasia in each year from 1861 to 1885.*

* Business decline.

† Business activity.

Emigration to British North America seems to run parallel with that to the United States, as in fact many emigrants take the way to the States via Canada, or change their residence from time to time after having found a first place of residence there. Furthermore, business aspects in both countries are usually subject to the same fluctuating periodicity. The relative respective attractive force as from centers of emigration is therefore best illustrated in the emigration statistics of Australasia and America. In the years of war, from 1861 to 1865, of a total of 717,796 to all countries, America absorbed 466,042, or 65 per cent.; Australasia absorbed 186,338, or 26 per cent. In the eight succeeding years of active trade in the United States, from 1866 to 1873, in a total of 1,485,623, America absorbed 1,145,884, or 77 per cent., while Australasia absorbed 133,100, or 9 per cent. A yearly average of 37,267 from 1861 to 1865, against an average of 16,637, in the years of activity, 1866 to 1873, in the United States, looked for homes at the antipodes. That not extraneous causes, like gold fever, &c., influence this changing attractiveness of Australasia, but the business aspects of the United States, will be seen from the following transcript of succeeding business periods.

In the five years of declining and depressed trade in the United States, from 1874 to 1878, inclusive, in a total of 655,513 to all countries, America absorbed 349,696, or 53 per cent., and the tide to Australasia rose again to 186,144, or 28 per cent., a yearly average of 37,228.

In the three years of activity in the United States, from 1880 to 1882, inclusive, in a total of 749,910 to all countries America absorbed 524,577 or 70 per cent., while Australasia absorbed 84,155 or 11 per cent.; a yearly average for Australasia

EMIGRATION FROM EUROPE.

OCCUPATION OF EMIGRANTS.

Full lists of emigration statistics published by the board of trade have been forwarded to the Department. I will only call attention to such general details which will illustrate from a general point of view what I have taken as a basis of inquiry in my immediate district, that of North Staffordshire, to wit, the small number of skilled artisans of British and Irish origin leaving the United Kingdom for foreign countries:

A.—Occupations of adult passengers leaving the United Kingdom in 1885.

Though it must be admitted that a percentage of skilled artisans may be contained in "occupations not stated," yet it is presumable that those withholding their occupations are those belonging to that class of passengers who are classified as "cabin passengers," and among whom the artisan classes, as a rule, find no perceptible representation. In 1885 there were 51,428 cabin passengers. In 1881 there were 54,270 cabin passengers, and in the ten years, 1876-'85, there were 492,557, which, deducting gentlemen, professional men, merchants, shop-keepers, and clerks already enumerated, would pretty fairly absorb all "occupations not stated," so that the classification of artisans and mechanics would not be very materially altered by the residuum remaining over from a closer scrutiny of "occupation not stated." It is apparent from this that the manufacturing branches of the industries of the United States do not receive a very heavy contingent from the skilled labor of Great Britain.

It would be premature to enter into generalizations on this subject. It may be said, however, that the English workingman is a stay-at-home body. He loves his surroundings, habits, customs, family ties, and the charm of the many festive occasions, which weave a garland of flowers into his frugal and toilsome existence, makes him prefer the spot where he has been born and reared to many a land of promise from which he sees others not unfrequently return after a trial, glad to be back again among the old associates of their youth. Sentiment may have a great share in this phenomenon. But sentiment is one of the most powerful motors of human actions, wielding no small influence upon social dynamics, and is certainly able to explain many of the intricacies of the emigration problem.

WAGES.

Day wages, measured by the standard of the United States, are smaller in comparison measured by that of other countries relatively high. Considering, however, the more evenly distributed work and earnings, coupled with the low cost of commodities and living expenses, a frugal, sober workman, assisted by a wife of like inclination, can eke out a fairly satisfactory existence. Statistics of wages exist to a large extent, but seldom have they been stated by workingmen themselves. For the first time to my knowledge has a very extensive list been published in answers from secretaries of trade societies in the United Kingdom to questions formulated and sent out by the royal commission on trade depression. These answers have been published lately by this commission in appendix to Part II of their report. I give a tabulated list of the most important ones. There being several hundred, and many being repetitions in the same trade, it would uselessly fill space and time to reproduce them all:

EMIGRATION FROM EUROPE.

Wages and working-time of British artisans from answers from associations representing the interests of the working classes.

Place and name of trade society.	Wages paid per hour.	Equal to week.	Hours worked.	Weekly wages.	Twenty years ago.	Years of apprenticeship.	Remarks.

* Per day.

The wages marked down in the first column are paid by the hour; those in the fourth column by the week. The proportion of hour pay is very large; in fact, the by far greatest proportion of the two to three hundred trade societies reporting to the commission are paid by the hour. In most other trades, wherever practicable, piecowork is the rule. So far as compensation is concerned, the eight-hour question cannot well be raised, and the demand for goods, more than any other consideration, regulates the working time, which, however, seldom exceeds fifty-four hours for the full week. Taking the year through, however, many deductions come off from this time, and I doubt whether the average for the year round, taking full and dull weeks and play weeks, reaches eight hours for each of the three hundred working days of the year. The often-raised question whether ten hours' work, or rather the work of a nation, can be done in eight hours' time, has therefore found its practical solution in the effective work of Great Britain. Many of the vexed questions which agitate our bod- W

bring higher prices. I have, even now, in this time of depression, found many regulations in force engrafted by trade societies, which would probably be resented elsewhere as an undue interference, namely, in the glass trade, which deserves mention here. The blowers work in shifts of six hours; one man, however, is not allowed to do more than eight shifts a week and has a certain amount of work allotted to him for his shift, and if he finishes this in a shorter time he cannot take up new work but has to wait until his turn comes round again. All such regulations are enforced by the trade unions and have, so far as I can learn, worked without much jar for years without having disrupted the relative industries, or caused capital to remove its chattels to Utopia, where dividends and profits are guaranteed against the disturbing influences of agitation and varying trade aspects.

CONDITIONS IN THE POTTERIES.

The trade of this district—North Staffordshire—is principally pottery, and the conditions, so far as illustrated by working time and wages, have been fully set down in my report on pottery, printed in No. 63 of consular reports. I have since collected some additional details which explain more fully the general conditions of time and earnings. I give here the estimate of a manufacturer of varied and long experience concerning the annual wages of a hollow-ware presser in a year of trade depression, when not fully employed, and use his own words, fully illustrating the meaning of what has been said above:

A fair average hollow-ware presser's earnings might be placed at \$7.78 (see page 75 of No. 63 of consular reports) for a week of six days, but taking the present time it would be found that the four middle days of the week would fairly represent the time during which he would be employed, so that this \$7.78 would from this reason be reduced to, say \$5.83. This is higher than four days at \$1.30 a day, the daily average of \$7.78 per week, but arises from the fact that the two remaining days, that is Saturday and Monday, are scarcely ever full working days. Out of this time we must also take three weeks as representing holidays and loss of time from occasional breakdowns, &c., and then the sum would stand as follows: $\$5.83 \times 49 = \285.47 per annum, or \$5.49 per week.

Now supposing that this should represent the earnings of a family consisting of father, mother, and three children, and dependent only on the earnings of the head of the house, then the income would be expended in the following manner:

Item.	Cost.	Item.	Cost.
Rent.....	\$0 85	Coffee and sugar.....	\$0 16
Taxes.....	16	Beef, 4 pounds, at 16 cents.....	64
Fuel.....	32	Butter, 1 pound.....	30
Oil and candles.....	8	Bacon.....	12
Soap.....	12	Cheese.....	12
Sick club.....	18	Milk, 7 pints.....	21
School fees.....	16	Pudding for Sunday.....	12
Trifles.....	8	Clothing and bedding.....	49
Medical attendance.....	6	Shoes.....	18
Newspapers, &c.....	24	Vegetables.....	12
Bread.....	49		
Tea.....	12	Total.....	*5 32

* Which leaves a balance of 17 cents.

for the wife's income, who fre-

prices are taken, and these are unprecedentedly low; so in that case, if a little was taken from some of the charges the balance would be greater, and this would be to some extent obligatory, as present earnings would be below the given average. It would therefore follow that increased prices, which would accompany a brisker trade, would be met by a higher average amount of employment. A family of this kind would be looked upon as a respectable one. You will see that in this table no allowance is made for either beer or tobacco, and the wife is supposed to be adding nothing to the family income, but wholly occupied with domestic duties. This is what we should invariably find in such a family. It is further evident that this standard of living is only maintained by the most unrelaxing and systematic economy.

Should beer and tobacco be added to these expenses it would be done mainly by sacrificing to a large extent the expenses set down for clothing, milk, pudding, and a little more would have to be pinched from the items, beef, bacon, cheese. As the family grew up and the children began to work this income would be increased by different amounts, as time went on, varying from \$1.22 to \$3.65 per week. But they would not be able to appropriate the whole of this increase to purposes outside this table of expenses, as the children would cost more both to feed and to clothe. Still, with a family of this description, it is most probable that saving would now begin. This would as a rule take the form of, at first, one share of \$2.43 per month in a building society, which in this neighborhood is decidedly the most popular form of investment among the thrifty working classes, and as this increased income advanced from the \$1.22 level to the \$3.65 level another share might be taken up, thus opening a little prospect in old age.

Taking, however, a firm finding full employment as a rule for its work people, the average would be considerably higher, as may be seen from the information I have received on this item from one of the leading houses in Burslem:

I have gone through our wage-book this morning, and find that our sixteen hollow-ware pressers average per week, from January 4 to Saturday last (the 17th of July), \$6.88 per man per week. I also find they only commenced full work on the 3d of April, but that during the last six weeks a little overtime has been made.

In answer to a request to state to me the actual payment made to these sixteen hollow-ware pressers in wages for one week of full employment, within the period above named, I received the following reply:

I find that the largest weekly payment to our sixteen pressers averaged \$8.65 each man, while individual men have earned as much as \$10.95.

This instance would alone show the impossibility of estimating the cost of production by the weekly wages earned. Here we have in one district, in the same industry and the same occupation even, the averages of weekly earnings varying from \$5.35 to \$8.65, while the individual differences would be greater yet. The labor price paid by the piece, however, is for like work in the different factories the same.

ENGLISH AND AMERICAN CONDITIONS.

The low cost of living possible now under the rule of lowest prices of commodities ruling since a considerable time backward, coupled with fair employment the year round, makes life comparatively easy to the artisan classes, and they do not find cause for emigration unless opportunities of extraordinary attraction are offered by foreign countries. The small number of potters quoted in the report leaving the United Kingdom for the United States and foreign countries speaks for itself. My personal inquiries among the people and authorities have not given me an intimation that any greater number are leaving the country in the figures

hollow-ware presser at East Liverpool, Ohio, and now returned to his native place, gives the following as his comparative earnings, both here and in America, and the mode of spending his income:

Earnings of a hollow-ware presser in East Liverpool, taking his average working at about forty-five weeks, deducting seven weeks for the inclemency and severity of the winter months, also the general stagnation of the potting industry throughout the Eastern and Western States periodically, \$12.50 per week being good wages for a steady and competent presser; 45 weeks=\$562.50.

Earnings of a hollow-ware presser in the potteries in Staffordshire, working about forty-eight weeks in the year, getting on an average \$7.29 per week; 48 weeks=\$349.92.

Taking a man and wife with three children making a family of five persons.

The difference in articles and quantities consumed in favor of an American potter consists in the following, per week: 6 pounds of meat, one-fourth pound of coffee, 1 pound of bacon, one-half peck of potatoes, 1 dozen fresh eggs, 1 pound of butter, and a few other unimportant items which, however, could be easily supplied if needed without much additional outlay. What the English potter or workman in general has to forego is the more liberal consumption of meat and albuminous diet, which gives the American workingman the greater stamina and working power, for which he is so justly celebrated. The meat price is quoted higher than in America. This is due to a certain feigned objection—gradually working off, however—to imported meats. The men whom I only use the best English meat, and “poorer

to 16 cents per pound. If cheaper cuts are bought a more liberal meat diet can easily be indulged in. Still I hear it frequently mentioned by people who have an insight into the living methods of the working classes that if they have the money they buy only the best pieces.

Corroborating this, I have been told lately by one of the largest employers of labor in Lancashire that the butchers in his town raised the price of prime cuts lately a penny a pound, saying that the demand for best cuts by the working classes was so great that they find it difficult to dispose of inferior pieces. Bread and potatoes form a great part of the diet, and 1 peck of potatoes a week is undoubtedly under the mark. But it is important to notice that potatoes and especially bread is so much cheaper here than in the United States. Good wheaten bread is sold at 2 cents a pound out of the very flour brought from America from which the bread is made, for which an American has to pay nearly double the price. The weight and measure is everywhere guaranteed and the sale of adulterated articles strictly prohibited unless sold as what they really are. Only the other day a dealer was heavily fined for selling ground coffee mixed with chicory, as pure coffee, although he pleaded ignorance and that the fault lay with the wholesale dealer who supplied him with the article as pure and unadulterated coffee. Nor is the difference in the price of goods bought in small quantities so very great. In America this takes quite a good proportion out of the workingman's earnings. Among the prices given to me by one of my workingwomen in New York as what she pays for her provisions, I find 5 cents a quart for potatoes, which is 100 per cent. over the barrel price. All measures are gauged. The full pint of the best ale is sold to outdoor customers at 6 cents and in the bar-room at 8 cents, and the half pint, containing twice as much as our American beer glasses (half foam and thick glass bottoms), at 4 cents. In Germany a glass of beer containing nearly twice as much as an American glass is sold for 10 pfennige, or 2½ cents.

The dollar or two dollars of the workingman must supply him with all the means of subsistence for himself and family, and the sick fund and reserve fund for old age or incapacity. Every 5 or 10 cent piece saved to him a day from leakages created by private or public tax-gatherers mean to him either so much less comfort or so much more care and anxiety. It is therefore one of the most commendable endeavors of the British Government to bestow its care upon the enhancement of the purchasing power of the penny.

So far as clothing and dry goods in general are concerned I find that cotton goods are fully as cheap in the United States as here. Shirts and sheetings if anything are superior in quality for the same money with us, so far as I can judge from the articles exposed for sale in the retail stores. Articles of underwear for women, made of muslin, are far superior in workmanship and finish and cheaper in price in the United States, counting the difference in the price of imported materials. Nor can I find that men's shirts, when chiefly of cotton, are any cheaper here. Of boots and shoes, if factory made, the same may be said, though the leather of the better class of ready-made goods seems to be superior here, that is, better tanned. Custom-made boots and shoes, however, are considerably below American prices. A very good pair of gentlemen's laced gaiters, made to order, can be had at \$3.80 and \$7.29, the difference is

Goods made of wool, linen, and silk are considerably lower than our prices. A good suit of the best English tweed, worsted, or melton can be had, made to order, at from \$15 to \$20. A spring overcoat of excellent quality, with best silk sleeve-lining, I had measured for \$18.25. The same articles can be had for much less if made of inferior goods or by cheaper tailors. The difference in the prices of ready-made things, as said above, is not so marked, however, and this is mainly due to the comparatively low price and superiority of tailor-made garments, on account of which they are preferred by the working classes even, and have not given the impetus to the wholesale manufacture of clothing which is maintained and supported in the United States, principally by the high cost of merchant tailor made articles of clothing. In workmanship and finish I find corresponding articles of the wholesale process of manufacture superior in the United States. This is true of clothing as well as of collars, cuffs, and like articles. Though not better in quality, yet the latter seem to have a more merchantable appearance to the eye. In many articles, such as ladies' underwear of muslin and linen, if freed from duties on embroideries and other imported materials, I have no doubt a good export trade could be established, in consequence of the much greater perfection in workmanship and finish than what I find here.

HOUSING.

Much has been said in the United States at different times, and repeated lately there, in quarters where full and reliable information on the subject might be justly expected, of the degrading condition and the promiscuous herding, without regard to sex, age, or relationship of the working potters in this district, of eight and even sixteen persons living in one room being the rule, &c., the papers brought reports as representing the conditions here. The statement naturally found its way into the papers here, and I have made diligent inquiry, therefore, from the vital statistics of the district with a view of getting at the true facts. I find a population of 200,758 of the pottery district is supplied with 37,803 houses, which gives one house to every 5.3 inhabitants.

Dividing the total among each of the towns comprising the potteries of North Staffordshire we find in each one the same ratio maintained.

Number of houses and inhabitants and number of inhabitants to each inhabited house in each of the towns of the pottery district of North Staffordshire.

Name of town.	Houses.	Inhabitants.	Inhabitants to each house.
Tunstall	5,429	29,673	5.46
Burslem	5,358	28,248	5.27
Hanley	10,176	54,274	5.33
Stoke	3,205	17,274	5.39
Fenton	2,682	14,136	5.27
Longton	3,498	18,615	5.30
Newcastle	4,092	20,996	5.13
Wolstanton	3,363	17,542	5.21

and statements such as those mentioned above, it must be clear from the figures, have no basis of facts whatever to stand upon. I have not been able to learn of many cases where more than one family inhabit one house. The workingmen's houses are all built on the cottage system, and mostly have one large front room immediately opening into the street, which serves as sitting-room or parlor, a kitchen in the rear, one large bedroom upstairs, taking the whole fronting on the street, with two windows, and in the larger houses two bedrooms in the rear. The outhouse is always in the yard. There are few houses so poor that have no flower-pots in the windows, and many have a flower-bed either in the yard, or, where practicable, a little plot in the front. The people show a great interest in flowers. The ground floors are paved with bricks; in the newer houses with tiles; some of the larger ones have boards. The sleeping-rooms are all floored with boards. Matting or carpet of some kind usually covers the floors of the lower rooms. As the life is an outdoor life, and the doors are open in summer time to the view of any passing visitor, it is easy to gain an insight into the home-life and habits of the working classes. The scrubbing and cleaning that goes on on a Saturday, and the general appearance itself of the rooms does give a very favorable impression as to cleanliness. Of course, there are exceptions to that to be found, especially in the poorer wards, but these exceptions make the generally favorable appearance only the more pronounced.

MARRIAGES AND BIRTHS.

Marriages here are contracted early in life. The many young couples one meets in the streets with a baby carriage and frequently one or two little pedestrians trotting alongside demonstrates this fact fully to the eye, as also the innumerable groups of little ones playing in the streets whom one has to circumnavigate in the walks on a sunny afternoon in the neighboring towns and villages. Thus the loss sustained by emigration is more than supplied by the new crop of Britons coming up with unfailing regularity. To get at the facts of the average marriage age, I tried to obtain from the registrars of the district the statistics covering the case. I have succeeded in two cases, which, however, corroborating each other, give a satisfactory review of the whole situation.

The registrar for Burslem, Tunstall, and Wolstanton, writes:

I regret that it is not in my power to furnish you with any satisfactory statistics as to marriages for this district. I only attend and register at non-conformist places of worship and civil marriages at superintendent's office, and I have also a colleague who has perhaps about 10 per cent. more marriages in the year than I have, so that you can only get an approximate estimate. Subjoined is a brief summary of my marriages for 1884 and 1885, and I dare say it is a fair sample of the ages at which marriages are contracted in the district:

Year.	Under 20 years.	Over 20 and under 25.	Over 25 years.	Total.	Couples.
1884	9	78	57	144	72
1885	14	74	46	134	67

For the Stoke district the following letter);

EMIGRATION FROM EUROPE.

during the year 1885 was one hundred and twenty-seven, classified according to the ages mentioned in your letter, as follows:

Age.	Males.	Females.
Under the age of 20	1	9
Over 20 and under 25	64	61
Over 25 years of age	62	54

These marriages are those only which are attended and registered by registrars of marriages, and do not include those which are celebrated in the English Church or amongst the Jews, the former of which are registered by the officiating ministers and the latter by a registering officer of the Jews.

The greater portion of marriages are celebrated under twenty-five years of age.

The birth rate per 1,000 inhabitants and of illegitimacy per 1,000 births is as follows in the different countries of Europe, according to the best statistical authorities:

Number of births to 1,000 inhabitants and number of illegitimate children in 1,000 births in different parts of Europe.

Countries.	Births to 1,000 inhabitants.	Illegiti- mates to 1,000 births.	Countries.	Births to 1,000 inhabitants.	Illegiti- mates to 1,000 births.
England	35.80	45	Holland	36.2	35
Scotland	35.20	89	Belgium	32.2	70
Ireland	26.50	23	Denmark	31.2	112
France	25.6	76	Sweden	30.3	102
Germany	39.8	84	Italy	36.9	68
Austria	39.9	129	Spain	37.2	55
Hungary	43.0				

The statistics of my immediate district show the following data:

Number of births and illegitimate births, and illegitimate births in 1,000 births, in the pottery district in the year 1885.

STOKE-UPON-TRENT REGISTRATION DISTRICT.

Towns.	Births.	Legiti- mate.	Illegiti- mate.	Illegiti- mates in 1,000 births.
Hanley	1,077	1,034	43	40
Shelton	1,081	1,030	51	47
Stoke	679	620	59	86

Longton	864	777	87	100
Total	4,319	4,048	271	63

WOLSTANTON REGISTRATION DISTRICT, 1884.

CHARITABLE INSTITUTIONS.

The charitable institutions of the district are in excellent condition. I have visited the North Staffordshire Infirmary, erected and supported by voluntary contributions, and cannot say that I have ever found an establishment better fitted up and kept in finer trim for its purposes. The scrupulous cleanliness in which all wards and departments are kept is well worthy of mention here. The receipts are from private donations and income from investments. I inclose an annual balance sheet which gives in full all details of income and expenditure and the amounts spent for each item, as it may serve a valuable purpose to compare with our cost for the maintenance of an average of about 175 patients and some 60 attendants :

Statement of accounts from October 25, 1884, to October 25, 1885.

EMIGRATION FROM EUROPE.

Underneath I give the expenditure since 1875 and average per bed and per patient:

Expenditure since 1875, and averages per bed and per patient.

Year.	Total expenditure.	Cost of each in-patient.	Cost of drugs for each out-patient.	Cost of bed occupied for the whole year.	Cost per inmate (pa-tients and household) per week in provisions, stimulants, and gas.	Daily average of pa-tients in ward.	Daily average of house-hold.	Average stay in days of each in-patient.
	£	£ s. d.	s. d.	£ s. d.	s. d.			
1875-'76	7,321	5 17 0	2 4 ³ / ₄	65 0 4	7 4 ¹ / ₂	112.6	48.9	36
1876-'77	7,404	4 18 9	2 8 ¹ / ₄	64 1 2	7 7 ¹ / ₄	115.7	49.7	31.78
1877-'78	8,234	4 12 0 ³ / ₄	2 8	57 6 4	7 4	143.6	54.6	33.75
1878-'79	8,085	4 8 6	2 2 ¹ / ₂	52 10 4	6 9	154.08	56.7	35.44
1879-'80	8,012	4 9 11	2 3	54 17 7	7 1 ¹ / ₄	146.5	57	35.27
1880-'81	7,716	4 9 5	2 2	56 14 10	7 1 ³ / ₄	136	57	33.07
1881-'82	8,042	4 2 9	2 4	58 5 6	6 3	138	58	29.32
1882-'83	9,005	4 11 4 ¹ / ₂	1 8 ¹ / ₂	59 5 0	7 3 ¹ / ₂	152	60	31.63
1883-'84	7,985	4 5 9	1 9 ¹ / ₄	57 0 9	6 9	140	59	30.51
1884-'85	8,887	4 16 10 ³ / ₄		54 16 0		162	59	35.62

The comparative cost per head per day for the month of January, in each of the last four years for provisions consumed, was as follows: Cost of rations, &c., 1886, 22.79 cents; 1885, 24.46 cents; 1884, 24.10 cents; 1883, 25.36 cents. The present year shows the smallest expenditure, due to the low range of prices. The average daily number for the same period was as follows:

Character of relief.	1886.	1885.	1884.	1883.
Children	8	13	13	11
Patients	175	162	143	146
Establishment	62	60	60	58
Total	237	222	203	204

The cost of the daily ration was distributed among the various vict-uals forming the ration, as follows:

Cost per head per day in undermentioned items.

Articles.	1886.	1885.	1884.	1883.
	Cents.	Cents.	Cents.	Cents.
Bread, flour, and meal	1.90	2.10	2.28	2.40
Milk	2.26	2.44	2.26	2.42
Groceries	1.68	1.48	1.54	1.70
	2.64	2.54	2.74	2.62
	8.20	9.06	9.64	10.38

The cost of a ration per head is considerably in excess of what it would be to householders, as no meal or part of a meal which has once entered a sick room is ever used again on hygienic grounds.

The cost of the principal items of diet to the infirmary are as follows:

Bread.....	per pound..	\$0 02
Milk.....	per gallon..	20
Coffee.....	per pound..	26
Tea.....	do.....	42
Sugar.....	do.....	4½-5
Rice.....	do.....	2½
Cheese.....	do.....	10
Best butter.....	do.....	26
Beef.....	do.....	13
Mutton.....	do.....	13½
Pork and veal.....	do.....	13
Potatoes.....	per 252 pounds..	1 70
Fish.....	per pound..	5
Gas.....	per 1,000 feet..	73

This list of prices will give a fair comparison with prices paid in America by the quantity, and under like favorable terms and purchasing advantages.

The directors are of the most prominent and wealthiest people of the district, and the personal care and attendance they devote to this charitable purpose shows its fruit in the general appearance and favorable conditions of this benevolent institution.

As to poverty, there was a good deal of suffering this last winter, but the cases mostly belonged to the building trades, which, on account of the long and severe winter, suffered great interruption.

Otherwise I cannot find much in the queries sent out by the Department which is not covered by what has been said heretofore. Pauper emigration there is none, nor can I learn that the local or general government are assisting emigrants. The few that go, go voluntarily.

J. SCHOENHOF,
Consul.

UNITED STATES CONSULATE,
Tunstall, August 14, 1886.

SCOTLAND.

REPORT OF CONSUL MALMROS.*

The instructions of the Department are to report upon the emigration from this consular district to the United States. As, however, no records are kept either by the local authorities or those of the United Kingdom, classifying emigrants according to the localities they belong to otherwise than by drawing the broad distinction as to whether they have been residents of either England, Scotland, or Ireland, I have found it impossible, in regard to a number of statistics, to report separately upon the emigration from this consular district. Whenever therefore, figures are given referring to this district,

In the classification of emigrants according to their occupation the fact of their being British subjects only is considered worthy of attention by the authorities, and the records do not, therefore, show what number of persons following each occupation emigrate from each of the three great subdivisions of the country, England, Scotland, and Ireland, separately. It is, however, believed, and I think correctly, that the proportion which each of the several principal occupations represented amongst emigrants from England bears to the total number of emigrants from that section of the Kingdom does not vary greatly from that which emigrants of the same occupations from Scotland bear to the aggregate emigration from the latter section. When we come to Ireland the case is different. In the total emigration from that island the relative proportion of the agricultural classes, general laborers, and domestic servants is considerably larger, and of the industrial classes smaller, than in the emigration from either England or Scotland, but by how much the one is larger and the other smaller can, with such facts as are at present obtainable, not be ascertained with any degree of accuracy.

The subjoined table contains a list of emigrants to the United States of British and Irish origin during the years from 1879 to 1885 classified according to sex, occupation, proportionate percentage irrespective of occupation, and including infants of each of the nationalities mentioned.

TABLE A.—Emigration from Great Britain and Ireland to the United States.

CHARACTER OF EMIGRATION.

While the exact proportion of emigrants which the different classes of society furnish cannot be stated, it is certain that agriculturists, operatives in manufactories, and mechanics furnish the great body of emigrants from this district. Those drawn from the other classes are numerically not important. The morality, taking this word in its broad and not merely sexual sense, of the emigrants is good, and fully up to the average of that of the respective classes to which they belong. They are as a rule of good character, of frugal, industrious habits, either church members, or at least attend church service with considerable regularity, and are animated by a desire to succeed in life. Frugality is, however, generally speaking, not one of the virtues of coal miners. Worthless members of society amongst the emigrants are infrequent exceptions. The working classes are, however, not without faults, the most prominent of which is drunkenness, a vice here but too often met with. In this respect they compare unfavorably with the masses of some other countries; for example, of Italy or Greece. But inquiries on this subject have convinced me that a great improvement in this respect has taken place in the course of the last thirty or forty years; in fact, older, trustworthy persons, who either still are workingmen, or who commenced their life as such, agree in stating from their own personal experience that drunkenness amongst the classes from which the emigrants are principally drawn has diminished at least 50 per cent. since about 1850. Official or other reliable statistics on the subject are not published. The higher and the elementary education is well provided for, and meets the wants and just expectations of the community. Of the secondary education, *i. e.*, the one destined for the training of children for commercial, technical, and industrial pursuits, the same cannot be said. Its deficiencies are generally acknowledged and will be remedied in the near future.

The following table (B) of marriages in Scotland from 1855 to 1884, containing the percentage of those who signed marriage contract by writing and of those who signed by mark, shows the great progress in elementary education in Scotland during those years, reducing the percentage of illiteracy by nearly one-half.

TABLE B.—*Marriages in Scotland, 1855-1884.*

Years.	Percentage who married.						Percentage who signed.			
	Under 21 years.		Under 25 years.		Above 25 years.		By writing.		By mark.

45 to 50 years	16,893	2.39	8,317	1.18
50 and above	22,773	3.22	5,295	0.75
Not stated	670	0.10	1,144	0.16
Total	706,436	100.00	706,436	100.00

DIVORCE.

Statistics of decrees in divorce cases in Scotland are not published or collected, but I have succeeded in obtaining them from the records for the years 1875 to 1885, as shown in the table below, marked E:

TABLE E.—*Decrees in divorce cases pronounced in court of session from 1875 to 1885, inclusive.*

Year.	Artisans.	Agriculturists.	Merchants.	Professional.	Others.	Total.	Year.	Artisans.	Agriculturists.	Merchants.	Professional.	Others.	Total.
1875.....	16	1	5	4	15	41	1882.....	24	2	5	4	25	60
1876.....	20	2	8	8	29	67	1883.....	23	2	9	7	23	64
1877.....	21	2	9	5	27	64	1884.....	25	3	17	4	24	73
1878.....	28	1	7	7	27	70	1885.....	30	4	16	2	28	80
1879.....	24	3	9	7	14	57	Total.	259	23	110	60	273	725
1880.....	27	1	7	6	33	74							
1881.....	21	2	18	6	28	75							

The divorces referred to are all divorces from the bonds of matrimony. Decrees for mere separation from bed and board are seldom made in Scotland. Their proportion to absolute divorces is very nearly that of 1 of the former to each 50 of the latter.

Tables marked F and G, respectively, contain, the former statistics of percentage of illegitimate to total births in Scotland as a unit during the years 1855 to 1884, the latter table contains information on the same subject, but for the year 1884 only, and grouped according to districts, divisions, and counties.

A remarkable feature of illegitimacy in Scotland, as will be seen by reference to the following tables, is its very high percentage in the purely agricultural districts, largely exceeding that in towns and large cities. In this respect it differs from all other countries.

EMIGRATION FROM EUROPE.

VITAL STATISTICS.

TABLE F.—Population estimated to the middle of each year, with the number of births, deaths, and marriages registered in Scotland during each of the years 1855 to 1884, and their proportion to the population; also the excess of births over deaths, the illegitimate births, and their proportion to the total births.

Years.	Estimated population.	Births.		Deaths.	Marriages.	Excess of births over deaths.	Percentage to population.			Per cent. of illegitimate to total births.

In the year 1883, according to the registrar's return, 47 per cent. of the mothers who bore illegitimate children were in domestic service, 24 per cent. were factory workers, 10 per cent. were agricultural servants, 8 per cent. had no occupation, but were daughters of workingmen, 6 per cent. were seamstresses. Of nearly 4 per cent. no information is given on the point to the registrars, the mothers in most cases, however, being widows, while about 1 per cent. were the daughters of professional men. No information on the point is accessible in regard to any year subsequent to 1883. The probability, however, is that the percentage given for the latter year applies without considerable variation to the following as well as to preceding years. As a rule the fathers and mothers of illegitimate children in Scotland belong to the same classes of society, with a striking difference, however, in the case where the mothers belong to the class of domestic servants in towns.

The registrar-general of Scotland, in his report of 1871, the last one in which he investigates the causes of illegitimacy in the country, points out that in numerous instances the parents of these illegitimate children are true to each other, a woman having often been seduced by the same man, and then subsequently

child or of children, one of his main objects in marrying being to raise children who may support him in his old age when he will be unable to earn enough, if anything, for his own support. The registrar-general, after further pointing out that no connection can be traced in Scotland between the proportion of illegitimate births and ignorance or want of instruction, that the percentage of such illegitimacy is independent of the proportion of the number of marriages in a district to the number of its inhabitants; that there is neither a traceable connection between illegitimacy and (1) the proportion of large farms to small holdings, nor (2) between illegitimacy and excess, wherever such exists, of females over males in the population, and that (3) the degree of house accommodation does not appear to perceptibly influence the percentage of illegitimate births, concludes this part of his report of 1871 with the remark: "It will thus be seen that we have not yet discovered the solution of the problem as to illegitimacy."

While dwelling on this subject I may add there are not in Scotland, as in at least some of the minor states of the Continent, legal regulations throwing obstacles in the way of the marriage of poor laboring people, and leading necessarily to illicit cohabitation and illegitimate births, nor has the Scottish clergy, for generations at least, failed to attack the evil of illegal sexual connection; and the extraordinary frequency of bastardy in some of the rural counties cannot therefore be ascribed even partly to any neglect of duty in this respect on their part, nor can the source of evil be found in a want of innocent amusements, as all classes of the people engage often and with zeal in a great variety of healthy and pleasant outdoor games, such as golfing, curling, foot-ball, cricket, and many others. As to none of the special causes or social conditions which elsewhere are productive of an exceptionally large percentage of bastardy can be traced, the proportion of illegitimacy existing, for example, in the agricultural counties of Banff, (16.1 per cent.), Wigtown (16 per cent.), Kirkcudbright and Elgin (15.1 per cent. each), there seems to be but one hypothesis capable of accounting for it, and that is, that this illegitimacy does not present at all a case of true demoralization, *i. e.*, degradation from a higher moral plane, consciousness of moral guilt, or loss of self-respect, but one of an early arrested moral development in this special direction for, generally speaking, the Scottish people compare, from a moral point of view, favorably with other nations. From statistical records this hypothesis can indeed derive no support, because in preceding ages no such records were kept, but from occasional allusions in older writers and from oral tradition we may gather that illegitimacy in the above and other counties must always have been very numerous; and I am informed that the records of the kirk sessions justify the conclusion that in the matter of illegitimacy preceding generations could have had no claim to superiority over the people of our own times. In cases where parents of illegitimate children subsequently marry each other, they very generally remain faithful to their marital obligations, and little, if any, blame attaches in public opinion to the mother. The crimes of abortion and infanticide, rarely committed anywhere in Scotland, are, as may naturally be expected under the circumstances, almost unknown in the agricultural districts referred to, and, as may be expected, are, as may naturally be expected, not condoned by the authorities, would

large indeed. But this much is certain, that, with a steadily increasing population, the number of severe sentences pronounced by the courts and the number of convicts in the penitentiary have during the last fifty years rapidly and steadily declined; a fact attributable to the gradual growth of a more humane sentiment, as well in the nation at large, inclining a smaller number of individuals to commit atrocious crimes, as in the judges and legislators, inclining them in turn to milder sentences and a milder criminal legislation.

CONDITION OF WORKINGMEN.

Concerning the capability of the Scottish artisan operative in factories or agricultural laborer for the work he has to perform, it may be, I think, justly said, that while he as a rule does not accomplish as much work within the same number of hours as his American colleague, nor thinks as constantly or intently about ways of improving and better adapting his tools to the work he has to execute with them, in order to make his labor easier to himself or to increase his products, he undoubtedly is superior in these respects to Englishmen of the same class.

The Scottish workingman cannot at all be called stolid, as the English workingman is; on the contrary, he is of a rather active, inquiring, and combining turn of mind, the result, in part at least, of the manner in which the reformation in his country was commenced and carried through, and the peculiar ecclesiastical and social spirit and organization engendered by it. Those Scottish mechanics and factory operatives who in early youth emigrate to the United States acquire in their new and stimulating surroundings in the course of a few years many of the qualities above alluded to as characteristic of American workingmen.

The growth of prosperity among laboring men during the last 30 years may reasonably be inferred from the fact that the large increase of the population of Scotland during that time has been accompanied by actual decrease in the number of persons receiving parochial relief as paupers.

The following table, marked H, showing the progress of business of the Edinburgh and Leith Savings Bank, points to the same conclusion, of an increasing prosperity of the workingmen, 90 per cent. of the depositors of the bank belonging to this class.

* Population estimated to middle of year 1886.

That the workingmen are better off now than formerly is indeed generally admitted; but there is some difference of opinion amongst competent judges as to the degree in which their well-being has been increased. However, from inquiries I have made, I believe I am quite safe in saying that their condition has improved at least 30 per cent., making allowance for the, on the whole, probably slightly increased cost of living.

There is a unanimous concurrence of opinion to the effect that workingmen are very much better housed, clothed, and fed than they were some thirty years ago.

Relating to the condition, past and present, of the class of manual laborers in Great Britain, I insert the following extract of a lately published letter by Mr. J. Bright:

Let your workmen (says Mr. Bright) reflect on the change in their condition which free trade has made within the last forty years since the reform of our tariff. The corn law was intended to keep wheat at the price of 80s. the quarter; it is now under 40s. the quarter. The price of tea is now less than the duty which was paid upon it in former days; sugar is not more than one-third of its cost when a monopoly of East and West India sugar existed. As to wages in Lancashire and Yorkshire, the weekly income of the thousands of workers in factories is nearly, if not quite, double that paid before the time when free trade was established. The wages of domestic servants in the county from which I come are in most cases doubled since that time. A working brick-setter told me lately that his wages are now 7s. 6d. per day; formerly he worked at the rate of 4s. per day. Some weeks ago I asked an eminent upholsterer in a great town in Scotland what had been the change in wages in his trade. He said that thirty or forty years ago he paid a cabinet-maker 12s. per week; he now pays him 28s. per week. If you inquire as to the wages of farm laborers you will find them doubled, or nearly doubled, in some counties, and generally over the whole country advanced more than 50 per cent., or one-half, while the price of food and the hours of labor have diminished.

For information on the manner and expenses of living at the present time of operatives in factories I refer to page 334; of miners, to page 340; and of agricultural laborers, to pages 341 and 342 of No. 71 of *Continental Reports*, published by the Department, containing a report from me on the elements of cost of certain articles.

INCOME AND EXPENDITURES.

mode of life, income and

Breakfast consists of tea and bread and butter for the parents, porridge for the children. Dinner: Principally broth, and beef boiled in it, potatoes; occasionally stewed steak or mutton in lieu of beef. Tea in the afternoon. Supper: Bread and butter, sometimes porridge.

£ s. d.

There are many tailors, masons
or of many other trades.

EMIGRATION FROM EUROPE.

The proportion of such men amongst journeymen tailors is small, compared with what it was thirty years ago, and is always becoming less. The proportion now is from 30 to 40 per cent.

MARRIED JOURNEYMAN SHOEMAKER.

House and expenses of house of married journeyman shoemaker and his wife and family of, say, two children.

The room and kitchen each contain on an average 1,200 cubic feet of space, say 12 by 12 feet and 10 feet to ceiling. The room furniture consists chiefly of table, four or five chairs, chest of drawers, carpet, bed, and pictures. The kitchen containing table, four or five chairs, dresser, bed, and clock; total cost, say £20. House rent £9 per annum.

Four meals daily are consumed, consisting of breakfast, dinner, tea, and supper. The breakfast is usually oatmeal porridge and milk, also a cup of tea or coffee, with bread and butter. When no porridge is taken ham and eggs, eggs, or fish substituted. Dinner, broth and beef, potatoes, otherwise beef and potatoes, or fish and potatoes, occasionally followed by pudding and milk. Tea in the afternoon, bread and butter, with occasionally cheese or preserves. Supper, cup of coffee, cocoa, or glass of beer, with bread and butter.

Clothing and its cost.

MANNER OF LIVING.

The houses in which journeymen shoemakers and other journeymen mechanics are living in large towns like Edinburgh are mostly built in the form of tenements, four stories high, entered by common staircases leading to each flat. Such a flat contains from two to four separate dwelling-places called houses, each house usually containing from two to four rooms. In old houses generally one W. C. serves each flat, but in the newer tenements every dwelling house has such accommodation. Those tenements contain tradesmen of every grade. Shoemakers are found on all the flats; generally they prefer the uppermost flat so as to secure the best light, as many work in their own houses. The shoemaker's house usually consists of two rooms; many are content with one room, and a few have three or more rooms. It is also customary for one shoemaker to rent a large room and relet it to mates for seat room at 6*d.* or 9*d.* per week, which is much taken advantage of by unmarried men and by some married men.

A general description of the manner of living of master mechanics can hardly be given on account of the very great difference of their degree of prosperity, the poorest being obliged to live on the bare necessities of life, while the most successful ones live surrounded by all the comforts and luxuries which moderate wealth usually procures. Between these extremes there exists of course a great variety in the manner of living.

VALUE OF EMIGRANTS.

No criminals or insane persons are sent from this district to the United States. Nor have persons receiving parochial relief of late years been induced to emigrate; although up to about ten years ago paupers for whom relatives living in the United States had bought and forwarded passage tickets were occasionally so far assisted by poor-house boards as to receive an outfit consisting of a kit for the voyage and some wearing apparel.

Considering the kind of persons emigrating from this district, and indeed from Scotland at large, I am of the opinion that they cannot fail to become a valuable addition to the population of any new country they may settle in, and this opinion is in no manner modified by the circumstance that these emigrants are not easily influenced by the doctrines of communists or so-called socialists.

COLONIAL ENCOURAGEMENT.

The value placed on emigrants from Great Britain has induced several of her colonies to offer assistance to emigrants to their shores in the shape of paying part of their passage money. Thus the Dominion of Canada grants assisted steerage passage to Quebec and Halifax at the following rates, to—

		£	s.	d.
Agricultural laborers.....	each..	3	0	0
Wives of agricultural laborers.....	do....	3	0	0
Children of agricultural laborers:				
Under 12 years.....	do....	1	10	0
Under 12 months.....				
Female domestic servants.....				

EMIGRATION FROM EUROPE.

The colony of Queensland grants free passages to single female domestic servants and to agricultural labors from seventeen to thirty-five years of age. (These laborers are specially selected in the country districts, and their free passes are all taken up for some time to come.) Besides, persons who have resided in the colony for six months can nominate others, who have been duly proved to be their relatives or friends, for free passages upon the following payments being made in the colony :

Sex.	1 to 12 years.	12 to 40 years.	40 to 55 years.
Male	£1	£2	£4
Female	1	1	4

The nominee must not be over fifty-five years of age. Artisans and mechanics are not eligible for nomination except by special permission of the colonial government.

The colony of Western Australia grants assisted passages at present only to farmers, agriculturists, millers, wheelwrights, and others likely to be useful in country districts, and they must be possessed of some small capital, the amount to be decided in each case by the Crown agents for the colony. As a rule, a married couple will be required to deposit not less than £100, and £25 for each child over twelve years old. The deposit is repaid immediately after their arrival in the colony.

In addition to the above, the Western Australia Land Company are under contract with the colonial government to introduce into the colony a limited number of assisted emigrants belonging to the following classes : Farm laborers, brickmakers, and quarrymen, under forty-five years of age, married couples with their children being preferred. The rates by steamer are fixed at £7 per adult, including £1 for ship's kit; children under twelve years, half price. Number so assisted will not exceed 1,000 per annum.

The colony also grants a limited number of free passages to emigrants nominated to the immigration board by residents in the colony.

Tasmania.—This colony assists immigrants only in the shape of so-called "nominated passages." Residents may nominate their friends in Great Britain at one of the following sums: Adult males, not over forty years old, £5 for each person; adult female, same age, £3; married couples not above forty-five years, £6; children between the ages of three and twelve taken at half price; children under three, accompanied by their parents, free. Emigrants nominated in the colony must be approved by the colonial agent-general in London and selected only from the classes of agriculturists, laborers, and domestic servants.

New Zealand.—The agent-general for the company in London will entertain applications for assisted passages for a limited number of farmers and agriculturists, possessed of small capital and intending to take up land in the colony, at the following rates, namely, £10 for each adult and £5 for each child between the ages of one and twelve years. The agent-general that he is to the satisfaction of the company of £50 for each

When the colony of Queensland and one or two other colonies, copying her methods, first began the system of subsidizing emigrants, the assistance was given in a rather indiscriminate manner. In consequence thereof and at an extravagant expense to these colonies their towns were soon overcrowded with people unable to find employment and much suffering and dissatisfaction has been the result.

At the present time greater care is taken in the selection of emigrants; a greater preference is given to those intending to take up land and to cultivate it, and though this change in the selection of emigrants has much diminished the annual accession to the population of the colonies concerned, it has turned out to be a more prudent system than the one formerly pursued.

That the several colonial systems of attracting immigration have to some extent been successful cannot be denied, yet their success has scarcely been such as to justify the expectation of seeing any really great stream of emigration, which otherwise would have gone to other countries, diverted to colonial shores.

Another plan of directing British emigration to the colonies holding out prospects of much greater success is that proposed by the National Association for State-directed Emigration. This plan is likely to be adopted. It is in its main features supported by great numbers of persons in Great Britain as well as in the colonies, distinguished in politics, industry, or commerce. The object of the plan is to secure the carrying out of a systematic emigration of British subjects to British colonies only, and on a self-supporting footing. The plan may be summarized thus:

(1) The Imperial Government to create a permanent colonization board, the representatives in London of co-operating colonies to sit ex-officio on the board. The board to be responsible to Her Majesty's secretary for the colonies.

(2) The Imperial Government to provide the necessary funds by securing a public loan at 2 per cent. or $2\frac{1}{2}$ per cent. interest.

(3) The co-operating colonies to place in the hands of the board tracts of public lands for colonization purposes.

(4) Emigrants to be of two classes: the first to be sent only to colonies where their labor is admittedly in demand; the second class to be planted as farmers on the lands placed in the hands of the board.

(5) Pioneer parties to clear and prepare lands, erect houses, &c., for the farmer emigrants to follow after them. Farmer emigrants found, after arrival, to be inexperienced, to be placed for a time with a pioneer party.

(6) People so settled on farming land to repay after first or second crop in, say, ten annual instalments the cost of their settlement, with interest at 4 per cent. per annum and 4 to 5 per cent. for administration expenses.

The estimated average cost of conveyance of a family (man, wife, and three children) and their maintenance until after arrival of first crop is: For Canada, £100 to £110; for Australia, New Zealand, or Tasmania, £150; for the Cape and Natal, £120 to £130. This is on the assumption that a free railway pass is given from the place of landing to the nearest point to the settlement. The railways in most colonies are property of the government.

No efforts should be made to supersede any existing system between colonial authorities and the Imperial Government.

It is estimated that £2,000,000 would be required the first year and £1,000,000 the second year, and that no further amounts would be required. The whole of these sums to be exclusively devoted to the cost of emigration and colonization, and no part thereof to be used for administrative expenses.

The plan above outlined will, if carried out, benefit greatly and more particularly the large class of poor agricultural laborers of late years thrown out of employment by the rapid introduction of agricultural machinery, and the consolidation of small farms into larger farms. Such consolidation has not, however, taken place to any extent in this consular district. This class also is by training and acquired habits well adapted to form successful farming settlements and to contribute to a healthy growth of the colonies in which they may be planted. But, while this is true, such assisted agricultural emigrants or other assisted emigrants are probably not quite as desirable an addition to the population of new countries as those who defray the expenses of their emigration themselves.

The cause of emigration from Great Britain is to be found in the fact that the country has arrived at a point of economical development where it has produced and continues to produce a surplus even greater of labor than of capital, for which it can find no profitable, or not as profitable, employment at home as in other countries. Both, therefore, surplus labor as well as capital, are transferred to markets where they can be invested to greater advantage.

(See also Tables Nos. 52, 54, 55, 56, 57, 59, and 68, 69 and 70 for data as to the trade between the United States and the Dominion of Canada.)	401

CONSULAR REPORTS
ON
COMMERCE, MANUFACTURES, ETC.

No. 77.—APRIL, 1887.

NOTE.

The following tables were printed in the Quarterly Report of the Chief of the Bureau of Statistics, Treasury Department, No. 2, 1886-'87. As the subjects to which they relate are of general interest, it has been deemed proper to issue the tables in the consular numbers, and this the Department is enabled to do through the courtesy of the Bureau of Statistics, Treasury Department.

No. 66.—The FISHERIES of the UNITED STATES in 1879—Continued.

The volume of the United States Census for 1880, containing the complete fishery statistics, has not yet been published. The following data, however, have been obtained from the Census Bulletins published from time to time. This information is given in five groups, viz :

- I.—The New England States.
- II.—The Middle Atlantic States.
- III.—The Southern Atlantic States.
- IV.—The Pacific States and Territories.
- V.—The Great Lakes.

No data are accessible as to the fisheries of the Gulf States other than is contained in the preceding table.

I.—THE NEW ENGLAND STATES.

MAINE.

THE SEA FISHERIES.

Quantities and values of sea products as they come from the water.

Kinds of products.	Quantity.	Value.
Grand total.....pounds..	202, 048, 449	<i>Dollars.</i> 1, 790, 849
First products:		
Mixed fish.....do....	38, 486, 060	297, 216
Cod.....do....	52, 494, 325	419, 955
Hake.....do....	23, 597, 730	58, 994
Haddock.....do....	12, 817, 075	80, 871
Pollock.....do....	5, 220, 000	20, 880
Cusk.....do....	1, 965, 600	14, 742
Mackerel.....do....	28, 594, 455	354, 300
Herring.....do....	21, 455, 192	122, 596
Total fish.....do....	184, 630, 437	1, 369, 554
Lobsters.....pounds..	14, 234, 182	268, 739
Clams.....bush..	^a 318, 383	90, 056
Enhancement in value of Southern oysters.....		37, 500
Other marine products.....		25, 000

^a An allowance of 10 pounds of meat is made for each bushel of clams.

Quantities and values of the sea products as put upon the market.

Kinds of products.	Weight when fresh.	Weight when prepared.	Bulk.	Value as sold.
Grand total.....	<i>Pounds.</i> 202, 048, 449	<i>Pounds.</i>		<i>Dollars.</i> 3, 614, 178
<i>Fresh fish.</i>				
For food.....	16, 597, 300			207, 965
For bait.....	17, 330, 000		86, 650 barrels.....	64, 988
For fertilizer.....	2, 790, 000		13, 950 barrels.....	6, 575
Total.....	36, 717, 300			279, 528
<i>Dry fish.</i>

FISH AND FISHERY PRODUCTS.

No. 66.—The FISHERIES of the UNITED STATES in 1879—MAINE—Continued.
 Showing the quantity of each of the various kinds of fish and other aquatic species taken,
 and the value of same after preparation for the market—Continued.

Kinds of products.	For other purposes.		Total for food and other purposes.	
	Used for bait.	Used for fertilizer.	Fresh.	Value as sold.
	Pounds.	Pounds.	Pounds.	Dollars.
Silver hake.....	400,000	350,000	750,000	1,300
Smelts.....			809,635	44,057
Sturgeon.....			12,500	600
Swordfish.....			347,100	6,215
Tomcod.....	52,000	310,000	362,000	2,361

^aThe tomcod used for food are taken by the river fishermen, while those used for bait and fertilizer are captured in the weirs along the outer shore. The former are classed with the river and the latter with the sea products.

NOTE.—In this table the total "catch" for each species is given separately. The figures, in many instances, do not agree with the totals for the different species as shown in the preceding table of sea products, as all fish, of whatever kind, sold fresh for food, bait, or fertilizer, as well as the miscellaneous pickled and canned fish, are there, for convenience, classed as "mixed fish." In the 38,486,060 pounds there shown as mixed fish are included 3,510,000 pounds of cod, 850,000 pounds of hake, 4,911,000 pounds of haddock, 300,000 pounds of pollock, 3,100,000 pounds of mackerel, 13,240,000 pounds of herring, 500,000 pounds of alewives, 540,000 pounds of cunners, 4,875,300 pounds of flounders, 600,000 pounds of halibut, 4,600,000 pounds of sculpins, 750,000 pounds of silver hake, 347,100 pounds of swordfish, and 362,000 pounds of tomcod.

FISH AND FISHERY

No. 66.—The FISHERIES of the UNITED STATES in 1879—THE SOUTHERN ATLANTIC STATES—Continued.

INDUSTRY.

THE OYSTER INDUSTRY.

THE OYSTER INDUSTRY.

Quantities, by States, of native oysters produced and the value of the same to the producer;
also the quantity rehandled and the enhancement in value in preparation for the market.

	Enhancement in value of
--	-------------------------

States.	Native oysters produced.	Value to fishermen.	Enhancement in value of other oysters in preparation for market. (a)		Total value of oysters as sold.
			Rehandled.	Enhancement	
	<i>Bushels.</i>	<i>Dollars.</i>	<i>Bushels.</i>	<i>Dollars.</i>	<i>Dollars.</i>
Total.....	b17,747,320	4,718,636	9,275,622	2,350,216	7,068,852
Maryland.....	c10,600,000	2,650,000	7,653,492	2,080,476	4,730,476
Virginia.....	c6,837,320	1,948,636	1,622,130	269,740	2,218,376
North Carolina.....	170,000	60,000			60,000
South Carolina.....	50,000	20,000			20,000
Georgia.....	70,000	35,000			35,000
Eastern Florida.....	20,000	5,000			5,000

a This includes the transportation of oysters from distant waters or to other markets in oyster vessels; also the increase in value due to planting, fattening, and canning.

b Each bushel of oysters is estimated to yield seven pounds of meats.

c Many of the oysters landed by the Maryland fleet are taken in Virginia waters; the total for Maryland is therefore much larger than the actual production of Maryland waters, while that for Virginia is correspondingly low.

Summary, by States, of the total quantity of fish and other aquatic species taken, and the value of same to the producers.

States.	Grand total of food and miscellaneous products.		Miscellaneous products, for fertilizers and other purposes.			
	Fishery products taken.	Value of same to fishermen.	Fish for fertilizers.	Value of oil, scrap, and compost.	Value of other products.	Total value of miscellaneous products.

NOTE.—Under "hard fish" are included wall-eyed pike, black bass, lake pike, muskallonge, and skinned catfish, with such amounts of whitefish and trout as could not be separated from the general sum. Under "soft fish" are placed saugers, white bass, suckers, and lake shad. The "rough fish" of Lake Erie are principally catfish, but at Toledo all kinds of fish undressed are termed "rough." The "rough fish" of Green Bay, Lake Michigan, includes the same kinds as the "coarse fish" of Lake Ontario, namely, all species except whitefish and trout. Under "mixed fish" are placed various amounts of all kinds of fish.

Total quantities and values of fresh and prepared fish, caviare, isinglass, and oil; and the aggregate value of the same.

a Includes the fisheries of Mackinac.

b Includes the fisheries of Detroit and Saint Clair Rivers, and of the small portion of Michigan bordering on Lake Erie.

NOTE.—The difference in the values of fish in the above tables is due to the fact that in the former the value is estimated on the basis of *fresh fish*, the latter on the basis of their value in the condition in which they are at last put into the market.

No. 67.—THE FISHING INDUSTRY.

The following data of the *Fishing Industry* are from the valuable report for 1886 of Mr. W. A. Wilcox, manager of the American Fish Bureau, Gloucester, Mass., who has a wide reputation as an authority in matters relating to this subject:

From the most reliable, available statistics, we find the fishing industry of North America and Europe gives employment to between 600,000 and 700,000 men and near 150,000 vessels, the total annual products being about 1,500,000 tons, or 3,000,000,000 pounds of fish, equal to 150,000 car-loads, which would load a railroad train 910 miles long.

A few of the leading nations that help make up these figures are as follows: The United States, with 101,684 fishermen and 6,605 vessels, not counting the small boats and unenrolled vessels of under 5 tons; Great Britain was reported to have 120,000 fishermen on January 1, 1887, with the following vessels:

	Ports.	Vessels.
England	57	4,352
Isle of Man	3	305
Scotland	21	4,459
Ireland	17	521
Total	98	9,637

France employs 126,000 persons in the sea fisheries proper and coast fisheries, the annual proceeds being valued at \$16,660,000; Norway produces for export \$11,900,000, and for home consumption \$3,500,000 to \$4,500,000 worth of fish; Italy produces \$9,520,000; Russia, \$16,600,000 annually; and Germany is reported as receiving annually \$18,326,000 worth of fish, two-thirds of which are herring.

Statement of the total quantity and value of the fish landed on the English and Welsh coasts during the twelve months ending December 31, 1886.

* In Great Britain.

THE NEW ENGLAND FISHERIES.

The history of the New England fisheries is one of peculiar interest. In its earliest days almost the sole industry of the colonies, the salary of the minister, the debt due the merchant—in fact most of the obligations being settled for in the staple commodity, fish.

Before the boy had reached his teens he was found on the deck of the fishing vessel serving his apprenticeship, and early learning to face and fear no danger. From such a school and training the early privateer and, later, the Navy have in times of pressing need found the material that always led to success. As the years pass swiftly by the numerous new and larger industries for a time attract more attention, yet the oldest industry in the country loses none of its interest; each day in the year finds something new from the ever, yet never, changing sea. As the record for the year is closed, a review always presents much of interest and variety from those of former ones. During the past eighteen months, since the expiration of the Washington Treaty with Great Britain, the fishing industry has attracted much attention. Much has been written, printed, and spoken, yet, unfortunately, it does not seem to be understood.

Probably few of the consumers, as well as many that from the agitation of the fisheries take an interest in them, could locate or have much of an idea where the bulk of the salt-water fish that supplies the nations are caught. They little think of the fisherman as sailing from home for weeks or months ere his return; as being from 150 to as far as 2,400 miles from home before he enters his little dory, and there, often 100 miles or more from the nearest land, beginning to take his cargo. Yet such is the fact. Often for days and weeks surrounded by a dense fog, frequently failing to find his vessel and drifting and suffering alone in the wide ocean subject to fearful storms and wrecks, "Last seen on Georges," or other distant fishing banks, being the only report, until the sad words must be spoken, "Given up," and the losses of the year have another addition to the long number gone before.

In the early history of the fishing industry of New England we find the business was carried on in small vessels or boats, that from the abundance of fish had no occasion to go far from shore. In those days the near-shore fishing grounds along the New England coast were well supplied with all the leading and desirable varieties of salt-water fish, and were of great value to the fishermen. The same, probably, might be said of the near-shore fishing grounds of the British provinces at that date.

As far back as 1818, the year of the treaty of London, which now comes to the front, very little attention was paid to the mackerel fishery, only 30,969 barrels being packed that year in Massachusetts; and for ten years—1809-1818, inclusive—the total pack was only 180,492 barrels.

With the exception of a few vessels that annually visited the Grand Banks or fished off the Labrador coast, neither the New England nor provincial fishermen had occasion to go far from their own shore, with no steamers or railroads for transshipment, no telegraph to call and receive or send reports and orders. Under such circumstances was the treaty of 1818 ratified.

In 1819 the mackerel fishery first makes much of a showing, the pack of Massachusetts being 100,111 barrels. Fluctuating, yet growing in importance up to 1831, in which year Massachusetts packed out 383,548 barrels, an amount that has never since been reached by this State in any one year.

As is well known, the mackerel is a migratory fish; while in one or a series of years it is found in immense quantities in one part of the North Atlantic Ocean and its

catch was made there. Since the introduction into general use of the purse seine, in 1870, we find nearly all of the mackerel catch has been made on the fishing ground of no nation, but on the high seas, or more than three miles from shore. Of late years, mackerel, in common with other varieties of fish that once were found plenty near shore, are now seldom found in abundance within three miles of land, and oftener wide out, or on the more distant fishing banks.

Scientific research has added much to the knowledge of the fisheries, yet where the mackerel come from in spring, where they go late in the fall and spend the winter, why they are found in great abundance off the New England coast for a series of years, and perhaps the next year in the Gulf of St. Lawrence, remains as much a mystery and matter of theory as one hundred years ago. The honest fact remains that while the near shore fisheries of New England and the British provinces are to a small extent valuable to the fishermen adjacent to them, they are not to others, the amount of fish there caught, compared with the aggregate catch, being insignificant, the bulk of the catch being taken on the distant fishing banks of the high seas, as shown by the accompanying diagram and description of the fishing grounds.

It is desirable that this question be fully understood. That the day may not be far distant when the fisherman with all his hardships, exposures, and dangers, may not be further harassed, and constantly have the danger of heavy fine or total loss of his property, for having crossed an imaginary and difficult-to-locate three-mile line, or availed himself of the common commercial right of all civilized nations—that every fisherman of whatever nation may take his fish wherever found with as much freedom as the fish now have to swim across the boundary line. This is no theory of the day, as we find as far back as the days of Queen Elizabeth, who is reported as having said to the King of Denmark, “The sea is free to all men. My fishermen have the right to fish in the sea wherever their vessels will float.” Certainly the insignificant amount caught near the shores of the North American continent is not worthy of the continual differences of two great nations. It is also hoped the day may soon arrive when the fishing industry may not be singled out from that of all others in any privations of commercial rights. Conforming cheerfully to all just laws, the fishermen may reasonably claim equality, justice, and such protection as the importance of their extra hazardous business calls for.

THE FISHING GROUNDS.

The fishing grounds of the Western Atlantic (see accompanying diagram) are the largest and most valuable in the world. They quickly attracted the attention of the early explorers who visited America, and who reported to their countrymen the extraordinary wealth of the western seas. At a period when nearly all Europe professed the Roman Catholic faith and fish was consumed in enormous quantities in the many church fasts, the discovery of such vast fishing grounds, teeming with their millions of undisturbed wealth, created the most profound sensation, and kings, noblemen, and wealthy merchants engaged in and fostered the enterprise of fishing with a zeal that we may now find difficult to realize or appreciate, and which has perhaps never since been equaled except in instances of mining excitement.

It is a well-established historical fact that the colonization of North America was largely due to the interest felt in the possession of the fishing grounds, and for their possession or retention fierce wars were waged between the French and English for upwards of two centuries; and Sabine* holds the opinion that the disputes and contentions which originated in the struggle for obtaining exclusive rights on the fishing banks by the English Colonists led ultimately to the Revolution of a new nation.

countrymen prior to the time of Columbus, but this story is improbable and, as Sabine says, "may be dismissed now as one which rests upon no clear and authentic testimony." The French fishermen were, however, the pioneers in the cod fisheries of the Western Atlantic, and it is fairly certain that as early as 1504 the Normans and Biscayans knew of the Newfoundland fisheries. Within twenty-five years of the discovery of America by Columbus the crews of 50 ships, Basque, Norman, Spanish, and Portuguese were plying their lines on the great banks of Newfoundland, more than three hundred years ago. In 1577 the French had employed not less than 150 vessels in the American fisheries, and we are told that "they prosecuted the business with great vigor and success." From that time to the present the fishing banks of the Western Atlantic have been visited by fleets of varying magnitude, and they have proved an unexampled storehouse of wealth in supplying innumerable millions with food.

These banks, of which we have so hastily and imperfectly sketched the early history, constitute a chain of submerged ocean plateaus elevated considerably above the surrounding sea bottom and extending from Cape Cod to and including the Flemish Cap off the eastern coast of Newfoundland. While there are cod-fishing grounds of some importance nearer the land, both off the coasts of the United States and the British provinces, these ocean banks generally are at considerable distance from the land and therefore free from any national jurisdiction. They are the natural and favorite resort of the cod and halibut, and, as previously stated, constitute the richest and most unfailing resort for fishermen which is known to exist. Elsewhere allusion is made to the extent and importance of the fishing grounds for mackerel and other migratory species; here we have only spoken of the banks proper which may or may not at times be valuable as a resort for mackerel.

LOCATION OF FISHING BANKS.

Georges Bank.—This fishing ground is celebrated for producing the finest codfish and halibut found off the North American continent. It is fished on at all times of the year by a large fleet from New England ports; seldom by vessels from other than United States ports. It extends about 70 miles north and south, and 80 miles east and west, in latitude 41° to $42^{\circ} 30'$, longitude $66^{\circ} 15'$ to 69° west. Lowest depths, 2½ fathoms; usual depths fished on, 25 to 80 fathoms. Halibut fares are taken on the east and northeast edge of the bank, in from 150 to 200 fathoms. Distance from Gloucester, ESE., 120 miles; the nearest land being Highland Light, Cape Cod, 95 miles.

Brown's Bank.—ENE. from Georges, in latitude $42^{\circ} 45'$, longitude 66° . From the shoalest water the nearest land is Cape Sable, 45 miles NE.

La Have Bank.—E. by S. from Brown's, in latitude 43° , longitude $64^{\circ} 15'$ distant from Brown's, 80 miles E. by S.; Shelburne, N. S., 60 miles distant, being the nearest land.

Sable Island Bank, or more generally known as *Western Bank*, in latitude 43° to $44^{\circ} 15'$, longitude $59^{\circ} 15'$ to $62^{\circ} 30'$, about 75 miles north and south, 135 miles east and west. Nearest land from the fishing ground, Canso, N. S., 80 miles.

Banquereau.—Next in the chain of fishing banks, in longitude 57° to 60° , latitude $44^{\circ} 05'$ to 45° , the western edge being just north of the eastern edge of Sable Island about east and west. Nearest land, Cape Canso, N. S., 80

Grand Bank of Newfoundland.—This celebrated bank, that for over three centuries has seldom failed of furnishing abundance of codfish, is triangular in shape, the longest direction being E. by S. and W. by N., in longitude 48° to 54° , latitude 43° to $47^{\circ} 30'$, being 270 miles wide, NNE. by SSW., and about the same distance in E. by S. and N. by W. direction. The shoalest water, 3 fathoms, is found on Virgin Rocks, Cape Race, Newfoundland, the nearest land being 90 miles from shoalest water, and Gloucester, Mass., is 885 miles distant.

Flemish Cap.—This ground is, to a small extent, fished on by American vessels; it is located about 300 miles east of the Grand Banks and some 1,200 miles from Gloucester.

Greenland.—Is annually visited by a few vessels from Gloucester on halibut trips; distance from home port 1,600 miles.

Iceland.—The most distant fishing grounds visited by American vessels; 2,400 miles from Gloucester, that port annually sending a small fleet, their catch being confined to halibut, of which a full fare is usually secured. Vessels from France and other European countries fish off this coast, mostly for codfish.

These fishing banks are the principal fishing grounds that supply the United States, and to more or less extent other nations, with salt fish. The outlines given do not always conform exactly with the charts. Of late years the fishermen have gradually extended the grounds fished on into deeper water. This is especially noticeable in the halibut fishery—vessels now fishing in from 200 to 400 fathoms, or 1,200 to 2,400 feet of water, yet locating their catch on a given bank.

According to the United States Fish Commission, the area of the offshore banks, exclusive of the fishing grounds off Greenland and Iceland, is 73,123 geographical square miles, all of which, being on the high seas, are under the control of no nation and free to all.

Capt. J. W. Collins, of the United States Fish Commission, in an article lately published in the *Century*, gives the area and location of the mackerel fishing ground as follows:

“According to a report on the fishing grounds of North America, prepared by the United States Fish Commission, the total area of the mackerel fishing grounds off the eastern coast of the United States is 56,000 geographical square miles. Here, in our own waters, the most extensive and valuable mackerel fishery of the world is carried on. In addition to this, our fishermen have the right to fish in the waters of the Gulf of St. Lawrence, outside the 3-mile limit; and thus is opened to them an additional area of 15,200 square miles, making a total of more than 70,000 square miles over which they have an unquestioned right to prosecute their operations. Now, if we estimate the area of inshore waters frequented by our fishermen in pursuit of mackerel, we will be able to get an idea of their relative importance, always supposing that the fishery can be prosecuted as well inshore as it can off, which is not the fact, as will be shown hereafter. The north shore of Prince Edward Island and Cape Breton are the localities in the inshore British waters which are now chiefly visited by American vessels in pursuit of mackerel. The total area of the inshore waters in these regions commonly resorted to by American fishermen does not exceed much 775 square miles (if we follow the coast line), or about one per cent. of the area of the mackerel fishing grounds to which they have an unquestioned right. Or, if we include the south shore of Nova Scotia and Cape Breton, the east side of Cape Breton and what is known as the ‘West Shore’—from Point Escuménac to Point Miscou—in the Gulf of St. Lawrence, we shall have a total area of 2,064 square miles. But a simple statement of the area of these inshore waters

FISH AND FISHERY PRODUCTS.

of Nova Scotia few fish are taken by American vessels, and these only during the migratory period. Thus it will be seen that the available area inside the limit is exceedingly small."

"Then, too, the change in the method of fishing has, in recent years, led to the almost practical abandonment of the mackerel fishery in the Gulf of St. Lawrence. Occasionally a considerable fleet enters the Gulf; but, since the results have generally been unsatisfactory, there have been seasons when only a very few vessels went there. It is true, perhaps, that, the mackerel being a remarkably erratic species, its movements cannot be predicted from year to year with any absolute certainty."

"The results obtained in the past ten years, since the universal employment of the purse seine, may serve, however, as a fair basis in judging of the future. It is an historical fact, now well established by the most accurate and careful investigation and inquiry, that the catch of mackerel in the Gulf of St. Lawrence, not to speak of the inshore waters under British control, has been of comparative insignificance during the last decade. And even under the most favorable conditions, when the catch there has been exceptionally large, as in 1885, the total product of the Gulf mackerel fishery did not amount to more than 8 per cent. of the entire catch of the New England fleet. Of this, less than one-third was taken inside of the 3-mile limit."

Fishing losses from January 1 to December 31, 1886.

Hailing port.	Vessels.	Tonnage.	Value.	Insurance.	Lives lost.
Portland, Me.	3	245.87	\$18,000	\$10,800	115
Gloucester, Mass.	17	1,182.75	115,800	93,345	2
Beverly, Mass.	2	32.15	2,700	1,800	
Salem, Mass.	1	21.41	2,000		
Swampscott, Mass.	1	23.29	1,500		
Boston, Mass.	2	154.56	13,500	7,000	1
Noank, Conn.	1	26.15	2,500		
Total	27	1,686.18	156,000	112,945	118

Mackerel vessels lost: Gloucester, 3; Portland, 2; Boston, 1. Other vessels lost were engaged in the cod, halibut and herring fisheries. Fifty-one lives lost from Gloucester vessels by being swept overboard or lost in the fog are included in the above. Thirty-eight seine boats and several seines lost by the mackerel fleet. Schooner Highland Light, of Wellfleet, on mackerel voyage, seized and confiscated by the British provincials. Schooner David J. Adams, of Gloucester, on codfish voyage, was the first vessel seized during the season, and yet remains in possession of the provinces; the case yet undecided.

IMPORTANCE OF THE FISHERIES.—Probably no industry, with equal capital, gives employment to and supports so many persons as the fisheries. The last official returns for the United States are as follows: Number of vessels, 6,605; tonnage, 208,297.82; persons employed, 131,426; capital invested, \$37,955,349.

The New England States make the following report for the past year: Vessels engaged in all branches of the fisheries, including oyster and whaling, 1,956; tonnage, 115,130; men employed, 17,996.

THE WHALE FISHERY.

[Abstract of the forty-third Annual Review of the Industry.]

New Bedford, January 24, 1887.—The Whalemens' Shipping List will this week publish the 43d annual review of the whale fishery of the United States for the past year. From advance sheets it is learned that the total number of vessels of all classes engaged in the fishery is 191, of which 19 hail from San Francisco, and all are engaged in the fishery. The pres-

barrels; whale oil, 18,253 barrels; whalebone, 184,511 pounds. Stock in the United States January 1, 1887: Sperm oil, 18,210 barrels; whale oil, 9,270 barrels; whalebone, 322,900 pounds. The average price of whale oil during the year was 33 cents per gallon; sperm oil, 74½ cents per gallon; whalebone, \$2.73 per pound.

PACIFIC FISHERIES.

[From San Francisco Chronicle.]

San Francisco, January 1, 1887.—Forty-four vessels were sent from this port to the Arctic last season to hunt for whales. Of these all but one, the tender Clara Light, returned. The Clara Light was crushed in the ice, and her catch, which was very small, was entirely lost. On their return to this port, and while setting out for the South Seas, the Atlantic and Mary and Helen were lost, the former being wrecked near the Cliff House, and the latter being burned at the oil refinery. The catch of these 43 vessels was 20,307 barrels of oil, 332,931 pounds of bone, and 5,273 pounds of ivory. About one-half of these vessels were owned in San Francisco.

The following statement of catches in the Pacific fisheries for twelve years is given for the purpose of comparison:

Years.	Oil.	Bone.	Ivory.	Years.	Oil.	Bone.	Ivory.
	<i>Barrels.</i>	<i>Pounds.</i>	<i>Pounds.</i>		<i>Barrels.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1874.....	10,000	86,000	7,600	1882.....	21,100	316,600	17,800
1875.....	16,300	157,000	25,400	1883.....	12,300	160,200	23,100
1876.....	2,800	8,800	7,000	1884.....	20,373	295,700	5,421
1877.....	13,900	139,600	74,000	1885.....	24,844	451,068	6,564
1878.....	9,600	73,300	30,000	1886.....	20,307	332,931	5,273
1879.....	17,400	127,500	32,900				
1880.....	23,200	339,000	15,300	Totals	214,524	2,842,499	265,758
1881.....	21,800	354,500	15,400				

The returns of oil, bone, and ivory made here for the past year are a little less than for 1885, but they are slightly in excess of the figures for 1884, so that the production would appear to be holding its own at least. Prices have been holding up fairly well, and on the whole there is no need for those engaged in the industry to feel discouraged.

THE CODFISHING FLEET OF THE PACIFIC COAST.

With one vessel less than in 1885, the codfishing fleet caught 155,000 fish less than the total for the previous year. The fleet of 1886 was composed of 11 vessels, one of which made three round trips, and another two.

The catch for the past season was taken from the following sources:

	No. of fish.
Choumagin Islands.....	566,000
Okhotsh Sea.....	426,000
Behring Sea.....	239,000
Total.....	1,231,000

Since the beginning of the codfishing industry in 1865 the annual catches have been as follows:

Year.	Vessels.	No. of fish.	Year.	Vessels.	No. of fish.
1865.....	7	469,400	1877.....	10	750,000
1866.....	18	724,000	1878.....	12	1,190,000
1867.....	19	943,400	1879.....	13	1,400,000
1868.....	10	608,000	1880.....		
1869.....	19				
1870.....	19				

FISH AND FISHERY PRODUCTS.

The catch of 1883 remains the highest in the codfishing history of the Pacific coast. During the past year 17,672 barrels and 298,007 boxes of salmon were received from Oregon, against 9,579 barrels and 212,516 boxes in 1885.

NOTES.

1. All of the above data are given for years ending June 30, except that the imports into the British provinces from 1850 to 1863 are for calendar years, and those for 1864 are for the six months ending June 30.

2. The imports into the British provinces from 1850 to 1867 comprise the imports into the provinces of Quebec and Ontario, as taken from the Canadian accounts, plus the exports to the other provinces of the present Dominion, as taken from the United States accounts; the imports into the British provinces for the remaining years are taken exclusively from the Canadian accounts, with the following additions from the United States accounts, viz: 1868, exports to British Columbia, \$1,178,813; 1869, exports from Minnesota, \$182,682; 1870, exports from Minnesota, \$172,210; 1873 to 1886, exports from the United States to Newfoundland and Labrador. The accounts of these exports, which were exclusively by water, are reliable.

3. The imports into the United States for 1864 and from 1868 to 1886 include the imports from all British North American Possessions.

4. For the gradual formation of the present Dominion of Canada see Statement No. 93.

5. The imports into the British North American provinces from 1850 to include 1875 are the imports entered for consumption, and those from 1876 to 1885, inclusive, are the general imports of merchandise.

No. 93.—STATEMENT showing the TOTAL VALUES of MERCHANDISE IMPORTED from the UNITED STATES into and entered for CONSUMPTION in the several Provinces of the DOMINION of CANADA, from its formation until its present composition, during each Year ending June 30, from 1868 to 1874, inclusive.

COAL MINES OF NEW SOUTH WALES.

REPORT OF CONSUL GRIFFIN.

The coal mines of New South Wales are by far the most important in the southern hemisphere. The mineral is of such excellent quality and the seams are so extensive and easily worked that we may well stand amazed at the promise of their future. The total area covered by the seams is estimated at 23,950 square miles. They extend from the twenty-ninth to the thirty-sixth parallel of south latitude and penetrate to the water's edge along many miles of the sea-coast. Mr. Keene, the late examiner of the coal-fields of this colony, traced the seams 700 miles north of the deposits near Newcastle, and found them covered and underlaid with the same fossil flora and fauna characteristic of the Newcastle district. He is fully satisfied that these deposits are amongst the most extensive and valuable in the world. In fact, some of the highest authorities on minerals, both in England and Australia, are very decided in the opinion that the New South Wales coal in many respects is superior to English coal, inasmuch as it is better adapted to steam purposes and richer in gas-giving properties. The lower beds of the coal series of this colony are said by geologists to be older than any worked in Europe, and the upper beds represent the most recent of the European true Carboniferous formations. It has been noticed that all the New South Wales seams, from the Silurian upwards, are uniform in their deposits, and this fact has led to the conclusion that this portion of the globe was comparatively free from violent eruptions and disturbances from the Silurian to the Permian period, and the alternate submergences and

tralasia, especially in Queensland and New Zealand. During the year 1885 the output of the Queensland mines was more than double that of 1884, but the combined products of the whole of the Australasian group are insignificant when compared with those of New South Wales. The government authorities have divided the coal-fields of New South Water into three districts, the northern, southern, and western.

THE NORTHERN DISTRICT.

The northern district produces not only the best coal but the greatest quantity. The famous Hunter River and Newcastle mines belong to that district. The shipping facilities at Newcastle are extraordinary, the tonnage of the port being at times as large as that of Sydney, the metropolitan city of Australasia.

Newcastle, which contains a population of about 30,000, is situated 75 miles north of Sydney, on the left bank of the Hunter River, at its mouth, which indeed forms the harbor of the port. The public buildings possess many and varied attractions. The custom-house, post-office, market building, and hospital, the churches, &c., are constructed in the most approved style of architecture, and show the taste and wealth of the inhabitants. Vast sums have been expended in the last few years in improving the harbor. The depth of water on the shores is 22 feet.

The machinery used for loading vessels with coal is of very high order. It consists of 7 steam cranes and 4 shoots, belonging to the government, and 5 cranes belonging to the Australian Agricultural Company, and 2 belonging to the Newcastle Company. These cranes have a loading capacity of from 12,000 to 14,000 tons per day. The cranes at Bullock Island Dock have a capacity of 6,000 tons daily. Those erected on the wharf formed by the dike comprise 2 of 25 tons each and 6 of 15 tons each. As much as 250 tons of coal have been put aboard ship at Newcastle in sixty-six minutes.

A branch line with a viaduct over Thorsby's Creek connects the wharves at Bullock Island with the Great Northern Railway. Naval-defense works have been constructed for the purpose of protecting the port in time of war. The fort at Flagstaff Hill, commanding the harbor, has three 9-inch guns and four rifled 80-pounders.

The quantity of coal produced in the northern district is about 2,350,000 tons per annum, more than two-thirds of the total coal product of the colony. In 1886 the output of the northern mines amounted to 2,415,112 tons. In 1885 there were 2,113,372 tons against 453,372 tons for the southern district and 311,762 tons for the western. The mines in the northern district are practically inexhaustible, and it is estimated that at the present rate of consumption they will last for the next seven hundred years.

The publication of the last report of the royal commission on the Newcastle collieries reveals many interesting facts in connection with the mines. The report is a very voluminous one and contains 181 collieries were examined by the

The commission was composed of gentlemen of large experience in coal mining, and especially in this colony. They examined as many as forty-five witnesses, and their testimony comprises one of the most valuable and interesting features in the report. The commission gave great attention, not only to the present condition of the mines, but to their prospective workings under the waters of the harbor or the Pacific Ocean. Very careful investigations were made as to the character of the strata shafts and underground workings in collieries some miles distant from the harbor but adjoining the Pacific Ocean. The area embraced measures from north to south $7\frac{1}{2}$ miles, and from east to west 4 miles, and comprises portions of the parishes of Kahiba on the south and of Newcastle on the north. The report, after mentioning that the district is overlaid with rocks belonging to the lower Coal Measures, states that the Newcastle seam, the lowest workable coal of this series of Carboniferous rocks, as well as the higher and superimposed coal seams, once covered the whole area under review, and which at a subsequent period was denuded in certain portions by the action of the atmosphere, rain, frost, or running water at a time when the relative height of the land to that of the ocean was different from what it now is. The alteration in the relative position of the land and water may have been caused by the changes in the earth's ecliptic, probably arising from the effects of climate near the poles, or, it may be, but less likely, from the volcanic forces with which the vast insular continent of Australia was assailed during post-Tertiary, or, geologically considered, in comparatively recent times.

QUALITY OF THE NORTH DISTRICT COAL.

The northern coals are pure bituminous coals, with strong coking properties. They contain much less ash than those from the southern and western districts, although it is said that many engineers in the British navy and in the merchant-marine service prefer the semi-bituminous coal to the northern, because the disadvantage of the greater proportion of ash in the former is counterbalanced by the fact that it burns more evenly and uniformly than the other; moreover, it does not so readily form into clinkers; but when it is required to get up steam rapidly the northern coal is preferred.

Mr. W. A. Dixon, F. C. S., of the School of Arts, of this city, made a series of analyses of the various coals of the world for the International Exhibition at Sydney, and perhaps a better idea of the character of the New South Wales coals can be formed from his investigations than from any other source. In the work he had in hand he followed the calculation given by Percy, which divides all the different kinds of coal into anthracite, bituminous, and hydrous coals. Mr. Dixon had also in mind the conditions laid down by the commission appointed by the Admiralty to investigate the British coals for the purpose of the navy, one of which was that coal should not progressively decay, for in so doing it becomes liable to spontaneous combustion. Another condition was that it should possess considerable cohesion of its particles, so as not to break into small fragments by constant attrition. Another point was that it should

COAL MINES OF NEW SOUTH WALES.

I am indebted to Mr. Dixon for the following table, showing the comparative specific gravity and percentage of sulphur, ash, and volatile hydrocarbons in New South Wales and British coals:

Average analyses.

Coals.	Number of samples.	Specific gravity.	Sulphur.	Ash.	Volatile hydrocarbons.
Newcastle, New South Wales.....	14	1.311	0.91	4.97	37.55
Western New South Wales.....	9	1.347	1.03	10.31	30.42
Southern New South Wales.....	7	1.374	0.65	10.25	20.84
Newcastle, England.....	17	1.246	1.24	3.82	36.44
Derbyshire, England.....	8	1.284	1.06	2.54	39.12
Lancashire, England.....	28	1.279	1.37	4.64	40.61
Welsh.....	31	1.318	1.34	4.15	21.15

According to this table a ton of New South Wales coal would occupy nearly 6 per cent. less space than an equal quantity of British coal. Mr. Dixon states that New South Wales coal contains less sulphur than the British, and consequently is not so liable to spontaneous combustion or to affect the purity of the atmosphere.

The following tables, prepared by Mr. Dixon, show the component parts of various samples of coal in the northern district:

SOUTHERN DISTRICT.

and

above the level of the plain, and the others lie superimposed at convenient distances above each other and cropping to the surface. These seams vary in thickness from 4 feet to 17 feet 6 inches. The mine at Mount Keira is worked at an elevation of 500 feet above the level of the sea. The seam descends gradually until it reaches almost to the level of the ocean at Coal Cliff. The mine at the latter place is a very valuable one; coal can be put almost immediately from the mouth of the tunnel there into the bunkers of the vessels.

The method of working at Mount Pleasant is simple and inexpensive. No steam machinery is required. The coal is run down from the mountain by means of revolving drums and wire ropes.

Wollongong, the sea-port of this district, is the third in rank in the colony. It is situated about 64 miles from Sydney. The harbor has been greatly improved by the construction of a breakwater, and excavations out of solid rock to a depth of 18 feet, and by other improvements, such as the drainage of the old basin. The area of the new basins, which now form one, is about 3 acres. The district in which the mines are situated is noted for its fine wheat and dairy farms. The average price of land in the district is about £20 (\$97.33) per acre. The farmers in this district have always complained of a scarcity of labor.

The subjoined table shows the component parts, specific gravity, of samples of coal from the southern district:

Locality.	Specific gravity.	Composition per cent., exclusive of water only.						Water, per cent.	Coke, per cent.	Calorific intensity (calculated).	Water converted into steam by 1 pound coal with calorimeter.
		Carbon.	Hydrogen.	Oxygen.	Nitrogen.	Sulphur.	Ash.				
Nattai.		91.24	3.60	0.59		trace	4.56

								1.733	76.436	7,875	12.54

THE WESTERN DISTRICT.

The western coals are much drier than those of the southern district, and contain considerable volatile matter. Mr. Dixon does not think that they will ever be exported in large quantities. He says, however, that they will answer for local purposes quite as well as many coals worked in Great Britain and France. Mr. Dixon examined nine samples of western coals for the International Exhibition, with the following results:

Table showing the average composition of western coals from nine analyses made by Mr. W. A. Dixon, F. C. S.

It was noticed that the ash in western coals was white and dense. In the northern samples it is often buff and red tinted.

From a series of analyses made by Professor Liversedge, of the Sydney University, I learn that the amount of ash in the coals from the northern district was 2.70 to 8.82 per cent., or upon an average of 5.41 per cent.; southern district from 4.41 to 13.52 per cent., average 10.02; western district from 6.88 to 12.91 per cent., average 9.87 per cent. ash. The subjoined tables by Mr. Dixon show the analysis of samples of coal in the western district:

No. 1.		1.329
Specific gravity		
<i>Proximate analysis.</i>		
Water		2.70
Volatile hydrocarbons		28.78
Fixed carbon		57.88
Ash		9.88
Sulphur		.76
		100.00

Ash: Gray.		<i>Analysis of ash.</i>	
Alumina		21.13	} Soluble in acid, 24.62
Ferric oxide		1.39	
Lime		.78	
Magnesia		.61	
Sulphuric oxide		.16	
Phosphoric oxide		.55	} Insoluble in acid, 75.23
Alumina		14.21	
Magnesia		trace	
Silica		61.02	
Undetermined and loss		.15	
		100.00	

No. 2.—A sample of the whole thickness of a four-foot seam at Katoomba.

It consists of a mixture of a bituminous and splint coal, with bright and dull colored pieces.

Specific gravity	1.343
<i>Proximate analysis.</i>	
Moisture	2.71
Volatile hydrocarbons	25.31
Fixed carbon	60.90
Ash	10.84
Sulphur	.24
	100.00

The coke is dense, scarcely swollen, but fairly lustrous; the ash is white. This is a fairly good coal, the low percentage of sulphur being particularly noteworthy.

Silica	60.21	
Undetermined and loss	.05	
	100.00	

Other samples of coal from this district have been examined with fully as favorable results. At Wallerawang (western district), 105 miles from Sydney, good coal, hard and compact, has been found. One sample from a seam 17½ feet thick yielded upon analysis 55.74 per cent. of fixed carbon, 33.24 volatile hydrocarbon, water 1.51, and ash 9.50 per cent.; specific gravity, 1.333; coke, 62.25.

Above the lowest seam was one of 6 feet 6 inches, and several others varying from 3 to 4 feet in thickness. There are extensive strata of limestone in the same district. They occur at the junction of the Coal Measures with Upper Silurian or Devonian beds, and consist of magnetite and brown hematite, as well as clay band ores, which are interstratified with the Coal Measures. The magnetite runs approximately north-east and northwest, and the magnetic effect is said to be so powerful as to render the compass useless in the neighborhood of the lode. The vein is 13 feet wide, the ore compact, and accompanied by silicious gangue. It yields about 41 per cent. of iron and is free from phosphorus and sulphur. The brown hematite vein has nearly the same direction as the above, and along the line of its outcrop great blocks of ore are scattered from 12 to 50 feet for nearly a mile. At a depth of 40 feet the vein is 18 to 20 feet thick, and the ore is composed of mammillated fibrous nodules. There are four seams of clay band which lie nearly horizontally, and crop out on both the east and west sides of the dividing range. The lowest is rather impure, but the others are good, containing from 49 to 56 per cent. of metal and very little sulphur or phosphorus. The seams average from 10 to 20 feet in thickness.

TOTAL OUTPUT.

The total output of all the mines in the year 1882

COAL MINES OF NEW SOUTH WALES.

suming 5 cubic feet per hour. It is exported to the neighboring colonies and to San Francisco, where it is used in the manufacture of gas. Indeed its properties are so rich, that an addition of 5 per cent. to ordinary bituminous coal is all that is required to give gas made therefrom the requisite illuminating power.

Considerable quantities of this shale are consumed in the colony in the manufacture of kerosene by the process of slow distillation. The quantity of kerosene shale oil made from it during the year 1886 was 112,000 gallons against 96,000 gallons for 1885. This oil, while not as good as the American, is becoming popular here, partly because it is of home manufacture, and from the fact that it is sold at a lower price than that imported from the United States, upon which there is a duty of 6d. (12 cents) per gallon. This subject has, however, been treated at length by me in my special report on "Kerosene and Kerosene Shale," published in No. 60 of the Consular Reports.

The total output of the coal mines of New South Wales since the commencement of coal mining, in 1858, is estimated in the government returns at 35,723,274 tons. The quantity produced in 1858 was 216,397 tons, valued at \$810,810. Of this 102,870 tons were used for home consumption; the remainder was exported. In 1868 the annual output had increased to 954,231 tons. In 1878 it was 1,575,497 tons; and in 1886, as previously stated, 3,000,000 tons. The quantity used for home consumption during 1886 was estimated at 1,300,000 tons.

Quantity and value of the output of the mines for each year from 1858 to 1886, inclusive.

Years.	Tons.	Value.	Years.	Tons.	Value.
1858.....	216,397	\$810,810	1873.....	1,192,862	\$3,328,735

1872.....	1,012,426	1,980,990			

The subjoined table shows the quantity and value of coal raised in each district for 1885:

District.	Quantity.	Value.
	Tons.	
	2,113,372	\$5,164,970
	453,720	1,152,530
	311,762	334,962

the Duckenfield, 215,723 tons; all in the same district. In the southern district the Mount Kembla mine produced 128,579 tons; the Osborn Wallsend, 108,579 tons. The next were Illawara, 99,841 tons, and Coal Cliff, 84,500 tons. The richest mines in the western district were the Lithgow Valley, 73,500 tons; Esk Bank, 67,615 tons; Zigzag, 60,000 tons, and Katomba, 40,000 tons.

The mine at Greta, northern district, is worked at a greater depth than any other in the colony, and that of the Agricultural Company comes next. The former is 450 feet, and the latter 303 feet in depth. Coal has, however, been found with the assistance of the diamond drill at a depth of several thousand feet. The greatest depth penetrated has been on the Sydney Coal Mining Company's property, near this city. Up to the 23d of January of the present year, 2,228 feet has been bored, and the bottom of the conglomerate was reached. Mr. C. S. Wilkinson the colonial geologist, and Mr. W. J. Slee, inspector of mines, were present at the withdrawal of the final tube, and it was found to contain as follows: One foot of coaly shale, a 3-inch band, 18 inches of semi-bituminous or bituminous and splint coal combined, and lastly shale and coal mixed, making in all about 4 feet of coaly shale and pure coal. Mr. Wilkinson is of the opinion that at a further depth of from 25 to 40 feet the main Carboniferous measure which runs through the district will be reached. The samples which have thus been unearthed are from the deepest coal deposit which has ever been reached in the southern hemisphere.

EXPORT OF COAL.

The total export of coal, from the opening of the mines in 1858 to the close of 1886, amounted to 22,428,585 tons, valued at \$110,027,480. The exports for 1886 were 1,735,865 tons, valued at \$4,735,010, against 1,756,356 tons, valued at \$4,833,315, for 1885.

The following table shows the quantity and value of the coal exports from New South Wales for each year from 1876 to 1886, inclusive:

Year.	Quantity.	Value.	Year.	Quantity.	Value.
	<i>Tons.</i>			<i>Tons.</i>	
1876	868,817	\$3,126,055	1882	1,261,545	\$3,235,165
1877	915,725	3,244,835	1883	1,512,445	4,148,310
1878	1,006,420	3,542,030	1884	1,690,763	4,655,225
1879	998,049	3,023,535	1885	1,756,356	4,833,315
1880	753,356	1,126,429	1886	1,735,865	4,735,010
1881	829,844	2,087,650			

COUNTRIES WHITHER EXPORTED.

The greater part of the coal exported from New South Wales is consumed by the neighboring colonies. Out of the total exports for 1886 the colonies consumed 1,027,775 tons, valued at \$2,724,120, Victoria receiving 640,655 tons, valued at \$1,684,895; South Australia 140,623 tons, valued at \$365,315; Tasmania 47,501 tons, valued at \$120,127; Zealand 175,217 tons, valued at \$453,187.

COAL MINES OF NEW SOUTH WALES.

The following table shows in detail the quantity and value of coal exported to each place from New South Wales for each year from 1884 to 1886, inclusive:

Port.	Quantity.	Value.	Port.	Quantity.	Value.
1884.	Tons.		1885—Continued.	Tons.	
Great Britain	5,000	\$136,000	Rangoon	10,243	\$31,790

MINERS' ACCIDENTS, DISPUTES ABOUT WAGES, ETC.

The total number of miners at the various collieries in New South Wales during the year 1885 was 7,197; of these 1,510 were employed above ground and 5,378 below ground.

An interesting feature in connection with coal mining in New South Wales is its comparative freedom from accidents, such as fire-damp explosions, which render the loss of life so appalling in Britain. The total number of accidents in New South Wales during the year were 51, and of these only 11 were fatal. Of the non-fatal accidents 31 occurred in the northern district and 9 in the southern district; of the fatal accidents 8 occurred in the northern district and 3 in the southern. The greater portion of these accidents were occasioned by the fall of coal, and but one or two from the explosion of gunpowder.

The wages paid to miners are from 10s. (\$2.43) to 15s. (\$3.65) per day. The wages and the number of hours the men are required to work have been the causes of frequent disturbances, which in some instances have led to serious rioting and loss of life. These disputes are usually settled by arbitration. They assume a very grave character when the coal companies insist on the employment of non-union men, or black-legs, as they are called by the miners. As many as 500 to 700 men are out on a strike at once, and it is astonishing the length of time they are enabled to hold out. One of the most noted of these strikes occurred last year, when 300 of the men struck at the Lambton mine, in the northern district. The men demanded additional pay as the difficulty of the work increased, and the labor council of their district approved the course. The miners hold

THE GOAJIRA PENINSULA.

The strike at Mount Kembla and Mount Keira, in the southern district, which began in December last, was of a very serious character. The men, after committing several acts of violence, refused every concession offered by their employers, and the dispute, which promised to become still more serious, was not settled until a large number of miners had been ordered from Europe by cable. It was then agreed that the men should resume duty upon the terms formerly proposed by their employers, and that the European miners should upon their arrival be provided with work upon other coal-fields in the same district.

G. W. GRIFFIN,
Consul.

UNITED STATES CONSULATE,
Sydney, New South Wales, February 9, 1887.

THE GOAJIRA PENINSULA.

REPORT OF CONSUL PLUMACHER.

The peninsula of the Goajira, which forms the extreme northwestern part of Venezuela, is chiefly remarkable for its entire abandonment into the hands of the Indians of the same name, who have succeeded up to the present day in preserving their absolute independence, recognizing no authority except that of their own chiefs.

Were this section distant from civilization, as are the Upper Orinoco and Amazon Indian regions, this state of affairs would excite no comment. But situated as it is between the progressive State of Zulia on the one hand and the settled Colombian territory of Rio Hacha on the other, it seems strange that no successful attempts have been made to open up a country which, from its favorable position and natural advantages, offers such an excellent field for colonization.

THE GOAJIRA INDIANS.

At the time of the Spanish conquest the Goajiras occupied their present territory, but tradition is almost silent respecting their remote antecedents.

They are divided into different tribes or clans, all, however, being of the same race, with similar language and customs, and the different divisions now existing are no doubt developments of individual families of the same general stock. They are robust and warlike, with dark complexions and straight hair, and, like most savages, are irreclaimably given to raids and robberies, keeping the interior of the peninsula in an almost constant turmoil.

The Venezuelan Government has contented itself with placing a military post on the frontier for the protection of the whites who, attracted by the fine grazing country, have established cattle farms and small settlements in the neighborhood.

Indians at times combine in

wards all who are not of their own race, yet they are quite alive to the advantages of trade, and in the dry season make frequent visits to the frontier settlements, where they exchange their cattle, horses, asses, &c., for the products of civilization, among which rum holds the first rank. They barter also for calicoes, sheeting, beads, knives, and other articles useful to the savage, but which he has not the means or ingenuity to supply for himself, giving in exchange animals of their own breeding and not unfrequently young children and girls, which latter become the mistresses of their purchasers, and the former are trained to domestic service.

When the Indians are not unquiet it is frequently the case that traders penetrate into the interior, and these expeditions have at times given great profit. It is necessary, however, for the security of the individual that he should have some special bond of union with the prominent caciques, and this is generally marriage, which has become a mere matter of trade.

On account of the division of the Indians into various tribes, usually at feud with each other, it often happens that a trader has several wives, each being of influence in her particular clan, which insures her husband a safe-conduct in her own district, where she continues to reside among her people, and seeing her husband only when he may chance to visit that particular region.

Marriage of this character is a somewhat expensive luxury, as besides the articles of value, amounting sometimes to several hundreds of dollars, given to the girl's father, all of her relatives, to the most remote degree of kin, expect to be favored with gifts.

CUSTOMS OF THE INDIANS.

These Indians know but little of agriculture, but engage largely in the breeding of cattle, for which the peninsula is most admirably adapted. Maize and vegetables are cultivated on a small scale, and cotton, which grows wild in some localities, gives exceptional returns when any attention is paid to its culture.

The women spin their own yarns, and with rude hand-and-foot looms weave a substantial fabric of which they make hammocks and other articles which are durably dyed in various colors by peculiar earths and the juices of trees and plants.

The customs of the Goajiras are singular and interesting, and it is noticeable that their laws and usages have remained without change from time immemorial. One of their most striking customs is a complicated system of what is called by them "payment of tears and blood," and this is the principal cause of the conflicts between the clans.

Among all savages revenge is a sacred duty, and as according to Goajira ethics an entire tribe is supposed to be responsible in the aggregate and individually for the acts of one of its members, a trifling affair in the beginning may produce grave consequences ultimately. This is one of the reasons why it is so dangerous for white men to enter the Goajira territory, as the Indians make no distinctions of nationality, but consider all who are not of themselves as belonging to one grand family, all the members of which are responsible for a wrong or outrage committed by an individual.

pecially those on his mother's side, who are supposed to be of a closer relationship than the family of his father.

The complication of this system will be seen from the following examples:

(1) *Self-inflicted injuries*.—If an Indian accidentally wound himself, break a limb, or meet with any similar accident, his mother's family immediately demand of him the "payment of blood," on the theory that, as his blood is also their own, he has no right to shed it without making compensation. The relatives of his father also claim the payment of their tears, which is of less value. Even the friends who may have witnessed the accident are entitled to compensation for the grief into which they were plunged at seeing their companion suffer.

The amount of the payment depends upon the character of the injury. A trifling cut of the finger calls for a little corn, a kid, or something of equal value, and if the matter is more serious nothing less than a goat or a sheep, or perhaps a cow, can assuage the sorrow of the sympathizing relatives.

If the injured party is too poor to satisfy these exigencies he must go begging, going from hut to hut, and no one will refuse to contribute his mite to assist in the performance of a recognized duty.

(2) *Injuries inflicted by animals*.—If an Indian borrows a horse from a friend and is thrown, or in any way injured, his relatives demand compensation from the owner of the animal, alleging with undeniable logic that the accident could not have happened had he not lent it. In case a person is injured by his own animal he himself must compensate his relatives accordingly.

(3) *General responsibility*.—This is of daily occurrence, and may happen in various ways. For example, the seller of any article is responsible for the results which may follow from its misuse. For this reason traders penetrating to the interior do not carry rum for traffic unless they are strong enough to defend themselves and property, as should compensation for the results of over-indulgence be denied, the Indians would feel quite justified in seizing anything they might be able to lay hands upon.

It is considered an affront, which must be paid for, to call a Goajira by his Indian name, as nearly all have adopted Spanish patronymics and many have even become baptized, not from the slightest religious feelings or knowledge, but simply to enjoy a big spree gratis at the feast celebrating the ceremony, and to have afterwards god-fathers to appeal to and impose upon.

Pronouncing the name of a deceased Indian in presence of any of his surviving relations is also a most grave offense, and can only be condoned by large payments.

In these complicated laws of compensation, as may be imagined, strict justice is not always considered, as if a person should be wounded or lose his life while attempting to kill another, the latter must pay blood and tear money in the same manner as if he had been the aggressor. To such an extreme is this system carried that should a child be killed by one of its parents, the latter can demand from the

gown. During the first few days she must not drink water, sustaining herself only with a composition of medicinal herbs called "*haguape*." She is then publicly spoken of as "*surtirse surupauru*," the literal translation of which is, "shut up in her house."

The duration of this retirement varies according to the position of the family. The poorer Indians cannot permit their daughters to remain idle for more than a few weeks, while among the rich this seclusion may continue for two, three, or even four years.

During this time the girl learns all that a woman is supposed to know. She is taught to spin and weave, make clothing and hammocks, and everything pertaining to aboriginal domestic economy. The inactive life soon makes her fat, her complexion becomes clearer, and in many cases there may be noted absolute beauty of feature.

It is not forbidden to the young men to glance at her through the door (though they may not enter the house), provided the inspection is made with matrimonial ideas, and should an eligible suitor demand her hand, she is usually at once released and the bargain is made, although the richer bridegrooms often prefer that the full period of seclusion be observed.

When the young lady is thus restored to society a grand family feast is celebrated, cattle are killed and a ball organized, while the heroine of the day, dressed in the clothes which she has made during her retirement, and in the glory of her restored ornaments, is then considered as married without further ceremony except the payment of her stipulated price. This consideration generally takes the shape of cattle divided between the father and other relatives of the bride. The woman is then obliged to maintain her husband in food and clothing, and is the principal in all matters of business, no bargain made by a man being considered valid unless it has received the sanction of his wife. Women are treated with much consideration, and it is important for a stranger to gain their good will.

An Indian cannot maltreat his wife, as, by the law of compensation, her relatives would demand a reckoning, and should the woman die in childbirth the husband must pay to her father an amount equal to her original price, but if the wife prove unfaithful, which is of very rare occurrence, her father must refund to the husband the payment made at the time of the marriage. Should he be unable to satisfy this demand, he looks to the seducer to make good the amount, besides the "payment of tears" to the girl's mother.

Upon the death of the husband the wife becomes the inheritance of one of his brothers, usually the youngest, and if there are no brothers, of the nephew.

FUNERALS.

The death of an Indian is always followed by a grand debauch, the duration of which depends solely upon the quantity of liquor obtainable.

At a recent funeral feast of a great cacique more than one hundred and fifty bullock hides were exchanged for the rum consumed. As liquor is exceedingly cheap, and hides, being an important article of export, command a high price, the *ceremonial* sion may be *estimated*

an earthenware jar, and buried in the cemetery of the clan, which is usually a concealed spot surrounded by a hedge of living cactus.

DRESS.

The dress of the Indians is simple, and probably the same fashion has existed for centuries. The males, in every-day attire, wear a cloth around the loins and a plaited grass ring upon the head, but on occasions of ceremony they appear with handsome cotton mantles of variegated colors, head-dresses of feathers, and faces painted most extravagantly.

The dress of the women is a long voluminous gown, made exactly like a bag, with apertures for the head and arms. In a high wind these garments inflate, giving to their wearers the appearance of walking balloons. The females also paint profusely, but neither sex seems to have any conception of artistic effect.

The ornaments most esteemed are collars, necklaces, and bracelets of beads, which are used with great prodigality. These are for the most part of foreign make, but the most valued and the possession of which indicates wealth are the "tumas." These are roughly-shaped reddish stones, perforated for stringing, and comprising varieties of jasper, onyx, cornelian, and agate, and are apparently of great antiquity, having been handed down from generation to generation from long before the Spanish conquest. In no part of the Goajira peninsula have these stones been discovered in a natural state, and it is believed they were brought by the remote ancestors of the present race, who no doubt migrated from some other part of the continent.

In ancient graves, of which the Indians themselves have no record, the tumas have been found, and in all cases perforated like beads.

The possessor of a necklace of tumas may consider himself rich, but much suffering and privation will be endured rather than part with these heirlooms, and they are consequently most difficult to obtain even at a price far above their intrinsic value.

ARMS.

The traditional arms of the Goajiras are bows and arrows, and although they are plentifully supplied with fire-arms, they still cherish the weapons of their ancestors. Of the arrows there are three classes:

(1) The "*hatu*," pointed with a sharpened nail or hard wood for small game, such as birds and lizards.

(2) The "*siquarrai*," with barbed-iron points made of knife-blades, and used both in the chase and in war.

(3) The poisoned arrows called "*aimara*," about three feet long, and pointed with the spur of the sting-ray dipped in an active poison made from putrefied animal substances in the following manner: Dead toads, snakes, and other reptiles are placed in a vessel and allowed to remain until a homogeneous mass of rottenness is formed, which is condensed over the fire to a thick paste. The wound made by an arrow thus poisoned generally causes death in from five to ten days, the only possible

traders, as the large profits thus secured render the temptation irresistible.

FEATURES OF THE PENINSULA.

The extreme south of the Goajira region is well populated by whites engaged chiefly in stock-raising.

The general character of the country is that of a flat plain, with tracts of sand-hills here and there, and covered with a variety of grasses, of which I forward specimens and inclose a description.

There is an infinite variety of herbaceous plants, many of which are used by the Indians as remedies. I have secured a small collection of specimens, which I forward by this steamer, inclosing herewith a list and account of their reputed properties.

Towards the north and west of the territory there are ranges of hills of considerable elevation, and the country becomes more broken and wooded. Cattle thrive wonderfully in these plains, the great drawback being that in exceptionally dry years the want of water is severely felt. There are no running streams, but the rain which falls in the wet season forms lagoons from 1 to 3 feet in depth in the low levees of the savanna, which are supposed to last during the dry weather. As a rule the cattle-breeders have had general good fortune in this respect, but in 1885 there was no rain during a period of eleven months, a phenomenon which caused serious losses.

To provide against the contingency of the complete drying up of the lagoons, each breeder has near his house, and surrounded by a fence, an excavation of from 8 to 10 feet deep, and of a diameter proportionate to the number of his cattle. This excavation fills during the rainy season, and is then covered with a rude shed of branches to lessen the evaporation. This is the reserve stock of water in case of prolonged drought, and as the cattle, if allowed free access, would soon destroy the well entirely, the work of dipping out in buckets and pouring into a trough on the outside of the fence is a never-ceasing and tedious task, as no one has as yet thought to put up a pump and thus save time and labor. It is seldom, however, that this necessity arrives, as although the majority of the lagoons in the savanna always dry up before the commencement of the following rainy season, yet there are always a few which usually hold over sufficient water.

There is a curious circumstance connected with these miniature lakes, and for which I have heard no satisfactory explanation. Every one swarms with small fish, although the same spot may have been a few weeks before completely parched and dry. As the dry season advances one after another of the lagoons disappear, leaving their former beds exposed for months to a fierce sun, which makes it impossible to believe that the life of any aquatic animal could be preserved in a soil so burnt and arid. With the rains, however, the fish appear as usual, the Indians firmly believing that they fall from the sky.

Mr. Auguste Pelissier, a gentleman residing for years on the frontier, and who has given some thought to the subject, has a theory that the various birds (storks, cranes, ducks, pelicans, curlew, snipe, &c.) which frequent these lagoons in great numbers eject with their excrement the digested fish eggs, and that the

INDIAN RAIDS.

The constant risk of predatory incursions by the savages has been an undeniable drawback to the successful pursuit of cattle-raising on the frontier; but since the sound thrashing the Indians received about a year ago, it is believed that this danger is greatly lessened, if not entirely removed.

In February, 1886, the frontier district near the important town of Sinamaica was invaded by a force of about 250 mounted Goajiras and 150 on foot, armed with rifles in addition to their bows and arrows.

They succeeded, before the neighborhood was aroused, in driving off many hundreds of cattle and a large number of horses; but before they could cover their retreat a small mounted force of 55 whites attacked them and killed the chief cacique at the first fire. This so demoralized the robbers that the little band of assailants were able to recover all the property stolen, besides many fine horses belonging to the Indians, who, after suffering a slaughter which was almost a massacre, fled to the interior. This had a most wonderful effect, and if the Government had chosen to follow it up with a determination to preserve order and insure security for travelers and explorers throughout the entire peninsula, the task would not have been of difficult accomplishment.

CATTLE-BREEDING.

The cattle of the Goajira are not very large, but fatten well, and with care and ordinary good luck the profits are very satisfactory, it being calculated that in four years the original capital invested may be doubled.

The expenses are not great, as but few hands are employed, and wages range from 4 to 8 pesos per month, with board.

The cows are milked once a day, averaging about 8 quarts. During the day the cows and calves are separated in different parts of the savanna, and are brought to the corrals in the evening. The cows are then milked and the calves remain with their mothers during the night.

There is a fashion universal in South America of tying the calf to the fore leg of the mother during the milking, as it is believed that without this precaution the cow would give little or nothing.

As in most parts of the world the breeders at times have had to encounter disease among their stock similar to the cattle plague which caused a few years ago such serious losses in the United States, but it has never assumed alarming proportions.

One great and constant annoyance is caused by parasitic worms which burrow into the ears, anus, and navel of new-born animals, and in any other vulnerable spot, forming ulcers which often produce death. In all tropical countries one of the chief cares of a breeder is the sharp lookout which must be kept for these parasites, and their prompt removal as soon as discovered.

The position of the territory gives it ample shipping facilities, but not on that part of its coast pertaining to Venezuela.

One-half of the peninsula belongs to Colombia, which nation indeed claims it all, the matter now being under the arbitration of the Spanish court, and the magnificent bay of Bahia Honda, on the northwest, is the future harbor of the territory.

Recent surveys have been made by an English engineer with a view to find a good harbor on the east coast where a port and custom-house might be established with a railway to Maracaibo, thus making a port of call for ocean steamers and doing away with the necessity of entering the lake. The result of the surveys, however, have demonstrated the impracticability of this project, as no sheltered harbors exist and the depth of water along shore is not sufficient.

The southern limit of the region inhabited by the Goajiras is formed by the river Limon, whose neighborhood is worthy of careful exploration. For some distance from its mouth the country is somewhat settled both by breeders and agriculturists, as the soil is of unsurpassed fertility, but towards its headwaters, which take their rise in a mountain range near the Colombian frontier, civilization has never penetrated, and the country is as yet virgin. Mahogany and other valuable woods exist in abundance, and the flora generally is varied and valuable.

Clearing land would be a most profitable enterprise instead of an expense, and this being accomplished a colony of energetic agriculturists would obtain surprising results, as the proximity of the river renders irrigation of easy and cheap accomplishment and offers a facile outlet for the products of the soil and forests.

Near the sources of the river Limon excellent indications of the precious metals have been discovered by the few adventurous spirits who have penetrated those unexplored regions, and it is to be hoped that at no distant day this territory, doubtless rich in mineral wealth, and offering in other respects exceptional advantages to the settler, may be made the object of a thorough and minute examination.

E. H. PLUMACHER,
Consul.

UNITED STATES CONSULATE,
Maracaibo, March 15, 1887.

Description of specimens of grasses from Goajira peninsula forwarded to the Department of State.

Saladilla.—A fine nutritious grass, and the most esteemed for fattening cattle. In the dry season, however, the *saladilla* becomes covered with a black dust, rendering it unpalatable.

Cardillo.—A curious grass, filled with burs or *cardillos*, similar to the sand-burs of the United States. This grass is disseminated universally, growing in perfect harmony with other grasses, and is eaten, burs and all, by the cattle. Sheep and young goats and donkeys suffer much from the *cardillos*, as they are detached at a touch and embed themselves in the coat of the animal, causing ulcers to which the worms get access, often producing death.

Pata de gallina.—So called from a fancied resemblance to a hen's foot. This grass forms a thick green mat.

424 FIELD FOR AGRICULTURAL MACHINES IN GERMANY.

Paja San Antonio.—Resembling somewhat the *pata de gallina*, and equally valuable.
Paja del zorro.—A grass which is found in great abundance and has good properties, although inferior to the *saladilla*.

There are many other varieties of grasses scattered over the peninsula, and some no doubt are as yet unknown to the botanist. The *saladilla*, however, is by all accounts far superior to all others, and judging from the sleek, well-fed look of the cattle there can be no question that it is a most valuable pasture grass.

When certain portions of the savanna are completely overflowed during the rainy season there is found at the bottom of the lagoons a species of moss of which the cattle are very fond, and they may be noticed standing for hours with the water up to their bellies and diving under with great expertness in order to fish up mouthfuls of the coveted moss.

Description of the specimens of herbal remedies used by the Indians of the Goajira peninsula, and forwarded to the Department of State.

(1) *Palo amargo*.—The *palo amargo* is a tree somewhat resembling the olive in size and general appearance, its foliage being of a dark lustrous green. The bark is used by the Indians as a substitute for cascarilla in the treatment of fevers, and the results are said to be excellent. An infusion for the same purpose is also made from the leaves and flowers.

(2) *Sávila*.—Indian remedy for the gonorrhea. The *sávila* is a creeper, and when fresh contains a thick white milk. The method of applying this remedy is simply to cut off a few inches of the living plant and insert in the urethra as a bougie, changing it three or four times a day.

(3) *Barradera*.—A hot infusion is used as a vermifuge.

(4) *Pericon*.—Used in combination with the *barradera*, which then becomes not only a vermifuge but also a febrifuge.

(5) *Brusca* roots and flowers, pounded and well boiled in water. The water is then used as a friction in cases of rheumatism.

(6) *Brusca* in grain and in the bean.

(7) *Brusca* grain, roasted and pulverized. This is drunk as a substitute for coffee, and is said to be an excellent remedy for irritation or inflammation of the bowels.

(8) *Yerba de la India*.—Used as an infusion for coughs, chest diseases, and catarrh.

(9) *Pinga de perro*.—Hot infusion for the cure of diarrhea.

(10) *Tapa-leche*.—Said to be a remedy for small-pox.

(11) *Contra culebra*.—Antidote to bite of snakes and other venomous animals. Drink its infusion and apply the bruised plant to the wound.

(12) *Sen*.—A very powerful purge.

(13) *Morita*.—The water in which *morita* has been boiled is said to dry up syphilitic and other virulent ulcers.

(14) *Malvilla*.—Used in foot-baths in cases of fever.

(15) *Culantrillo*.—Infusion is given as a remedy for diarrhea.

(16) *Emetic bean* (name not ascertained).—A small portion powdered and administered in tepid water causes most violent vomiting.

(17) Remedy for dysentery, said to be very efficacious. It is made of pulverized goat manure, mixed with the chopped leaves of a plant, of which specimens could not be procured nor its name ascertained. A small quantity of this composition is said to cause bloody discharges to cease entirely in a few hours.

THE FIELD FOR AGRICULTURAL MACHINES IN GERMANY.

REPORT OF CONSUL GOODWIN.

A gentleman interested in Saxon agriculture* has just published an
 mass of statements and figures which seem to show
 in Saxony to a far greater this

machines were in use in Saxony two ways were suggested, one by means of inquiries directed to the several *landwirtschaftlichen Vereinen*, or farmers' clubs, which exist, if not in every farming village, certainly in every farming community of respectable size; the other by means of a canvass of the manufacturers who sell such machines to Saxon farmers.

In 1878 an enumeration showed that there were in use in Saxony 124 large agricultural machines of various kinds having steam power, and fifteen manufacturers, not including several who are known to have sold quite largely to Saxon farmers, report that between 1878 and 1887 they sold 39 machines, making the number of steam-power machines in use at the present time, according to this very imperfect reckoning, 163, of which 117 are movable and 46 stationary machines.

The idea of obtaining more complete information by soliciting answers from the farmers' clubs was found to be impracticable and was abandoned. There are 480 of these clubs in Saxony, not counting those organized to promote interest in special branches of agriculture and horticulture; it was found that the number of clubs was so great, the boundaries of the club districts so indistinct, and the organization of some so imperfect that it would be better to adopt the other plan and address inquiries to the manufacturers. Upon investigation this, too, was found to present difficulties because of the large number of firms and individuals scattered over a great territory, who have sold agricultural machines in Saxony, and because of the disinclination of many to furnish precise facts and figures. But the attempt was made, and, incomplete as are the results, the showing made is, as before said, surprising to many Saxons, and quite astonishing to those who have had no special opportunity to examine the subject.

Of 230 manufacturers, large and small, domestic and foreign, the question "How many agricultural machines and large implements have you sold to the farmers and authorities of Saxony within the last ten years?" was asked. Of this number only 43, or a little less than one-fifth of the whole number, returned specific replies. Among those who did not respond at all or failed to furnish precise information are several concerns whose business with Saxon farmers has been large, including a Saxon mowing-machine manufacturer, a large general agricultural manufacturing concern of South Germany, and the establishment of Rudolf Sack, of Plagwitz-Leipzig, which, from a small beginning in 1856, claims to have become in 1886 the leading plow-manufacturing concern in the world. The facts and figures supplied by the 43 firms and individuals referred to are found in this table:

Kind of machine.	No.	Kind of machine.	No.
Mowing-machines.....	1, 270	Machines for cutting turnips.....	3, 430
Horse-rakes.....	870	Mills for grinding and crushing.....	1, 000
Hay-turners.....	290	Thrashing-machines worked by steam and water power.....	226
Machines for sowing seed.....	1, 860	Thrashing-machines worked by horse-power.....	4, 360
Machines for planting potatoes.....	12	Thrashing-machines worked by hand....	880
Machines for harvesting potatoes.....	790	Implements for transferring power from previously existing steam-machines to thrashing.....	270
Machines for spreading manure.....	150		
Hoeing-machines (for hoeing rows).....	140		
Skim plows with more than one share....	600		
Cultivators and root-cutters.....	420		
Meadow-harrows.....			
Sorters.....			

426 FIELD FOR AGRICULTURAL MACHINES IN GERMANY.

date of his establishment in business, until January 1, 1886, he sold to all parts of the world, chiefly to Europe and South America, as follows:

Kind of machine.	No.	Kind of machine.	No.
Drill-machines.....	15,640	Plows for taking out potatoes.....	5,21C
Hoeing-machines.....	3,640	Plows for taking out turnips.....	1,28C
Deep-culture plows.....	18,150	Subsoil plows.....	4,27C
Universal plows.....	116,720	Plows for hilling corn, &c.....	5,15C
Plows with more than one share.....	22,120	Grubbees and root-cutters.....	3,14C
Side-hill plows.....	1,670	Harrows, &c.....	1,79C

Mr. Sack adds that in 1886 his sales included 30,000 plows of all kinds, but does not say how many of these were sold to Saxon farmers. As lately as 1870 his business was confined almost exclusively to Germany, but last year he had so developed his foreign trade that nearly 60 per cent. of his sales were exports. He began business in 1856, with Saxon trade almost exclusively; in 1876 only 15 per cent. of his sales were to Saxony; in 1886 only 7 per cent. In the latter year he says he sold 2,100 plows to Saxon farmers, and avers that his total sales of agricultural machines and implements to them in that year exceeded the sales of his competitors in ten years.

Mr. Sack also supplies a table, based upon the most complete information he could obtain, showing that there are in use in Saxony an average of 1 steam thrashing-machine for every farm of 100 hectares (1 hectare equal to 2.471 acres); 1 horse hay-turner for every farm of 90 hectares; 1 horse-rake for every farm of 65 hectares; 1 potato-harvester for every farm of 60 hectares; 1 cultivator for every farm of 60 hectares; 1 side-hill plow for every farm of 40 hectares; 1 hay and straw cutter for every farm of 40 hectares; 1 root-cutter for every farm of 35 hectares; 1 drill-plow for every farm of 30 hectares, and 1 horse thrashing-machine for every farm of 30 hectares. This calculation having been based upon a low estimate of the number of machines sold and in use is considered a long way within the limit of fact.

To show that the average number of modern machines in use in many sections of Saxony is larger than the general average, a number of statistical tables are furnished. For instance, the Farmers' Club of Zittau reports that in the twelve farming villages to which its membership is confined there are in use 208 cultivators, 237 hay and straw cutters, 194 root-cutters, 148 common thrashers, 135 horse thrashers, 40 side-hill plows, 38 mowing-machines, 34 drill-plows, 24 horse-rakes, 2 horse hay-turners, 1 steam thrasher, and 50 other machines of various kinds. This is equal to 1 cultivator for every farm of 10 hectares; 1 hay and straw-cutter for every farm of 8 hectares; 1 root-cutter for every farm of 12 hectares; 1 common thrasher for every farm of 20 hectares; 1 horse thrasher for every farm of 25 hectares; 1 mowing-machine for every farm of 39 hectares; 1 drill-plow for every farm of 39 hectares; 1 horse rake for every farm of 40 hectares; 1 hay-turner for every farm of 40 hectares; and 1 steam thrasher for every farm of 280 hectares.

turners, 4 drill-plows, 4 cultivators, 6 hand thrashers, 7 water-power thrashers, 30 root-cutters, 35 horse thrashers, and about 150 other machines of various kinds.

A manufacturer of agricultural implements who canvassed this and neighboring sections lately reported to his firm: "The farmers are so well supplied with machines and utensils that we must look elsewhere for a market for our machines."

Several farmers' clubs report that in their neighborhoods there are more mowing-machines and drill-plows in use than there are farms, while of steam plows and thrashers there are but few, because one of each of such machines does the work of several farms.

According to the latest statistics available from the office of the Saxon minister of the interior, there are 154,158 farms in Saxony, and only 18,801 large agricultural machines in use. The farms are divided as to size as follows:

Size of farm.	No.	Size of farm.	No.
0.2 to one hectare.....	56,020	50 to 100 hectares.....	806
1 to 2 hectares.....	21,464	100 to 200 hectares.....	526
2 to 5 hectares.....	29,881	200 to 500 hectares.....	225
5 to 10 hectares.....	17,826	500 to 1,000 hectares.....	6
10 to 20 hectares.....	18,437	Over 1,000 hectares.....	1
20 to 50 hectares.....	8,966		

That is to say, the claim is that of the smallest farms, viz, 0.2 to 1 hectare of land each, 0.014 per cent. are supplied with modern agricultural machines; of those of from 1 to 2 hectares, 0.159 per cent.; of those of from 2 to 5 hectares, 1.45 per cent.; of those of from 5 to 10 hectares, 11.27 per cent.; of those of from 10 to 20 hectares, 41.41 per cent.; of those of from 20 to 50 hectares, 77.05 per cent.; of those of from 50 to 100 hectares, 92 per cent.; those of from 100 to 200 hectares, 95.82 per cent.; those of from 200 to 500 hectares, 97 per cent.; above that size, 100 per cent.

These figures certainly make a much better showing for the Saxon farmers than people who have traveled over the country but who have not specially studied the subject have supposed; but it should not be taken for granted that there is not in Saxony at present an opportunity to sell improved agricultural machines. Much of the machinery and many of the implements in use and called "modern" would excite the risibilities of a wide-awake American manufacturer or a Western farmer.

There ought to be a good market here for American machines and utensils, in spite of all difficulties in the way, but there will never be until our manufacturers are prepared to go to work in the same careful, plodding, but energetic way that the Germans have worked to secure the large trade which they now control in South America, Central America, Australia, and the East. They must not expect, no matter how excellent their machines, to build up a trade here by now and then making a great splurge, or wholly by advertising in trade newspapers, or by the spasmodic efforts of a few traveling agents. The value of judicious advertising in first-class trade journals, American and foreign which have a circulation and standing

watch-trading stamp, whose aim is to entrap some confiding farmer into signing a note under the impression that he is merely signing a receipt or an agreement, but men of character and ability, having a thorough acquaintance with the German language, a complete knowledge of the uses and advantages of American machines, and a firm belief that they are superior to all others. Such men, well paid, would take great pride in their work and would in due time accomplish very important results.

The Bureau of Statistics at Washington shows that in ten years over \$6,000,000 worth of American agricultural machines have been sold in Germany. Probably most of the sales were made to the farmers of Bavaria, Thuringia, Baden, Wurtemberg, and the Rhine country, certainly a small proportion to Saxony. Intelligent, systematic, persevering effort on the part of our manufacturers would have made the figures nearer ten than six millions.

It is a mistake for the great agricultural-machine establishments of the United States to establish general agencies for all Europe in London. Germany is fast becoming independent of England in every way, and Germans would rather deal directly with Americans than indirectly through Englishmen.

Consul Lang, some time ago, made the suggestion that a permanent exhibition of American products and manufactures be established in Hamburg; an excellent idea, and one which the Germans have adopted in several parts, and profited by. If one of our largest agricultural-machine manufacturers would send over a thoroughly competent man, establish him in Berlin with a stock of manufactured machines for exhibition, and give him authority to select able assistants to be located in the chief commercial city of each of the German states and principalities, I believe that the sale of American machines and implements could be doubled in the next five years.

It is a great compliment to the ingenuity and practical skill of American workers that nearly every important agricultural machine manufactured in Germany, and especially those whose praises are extolled the highest, are patterned after American machines as closely as can be without infringement of patent rights. But though they can be sold cheaper than the American machines they are not nearly as good. Take the best American thrasher, for instance; it is much lighter than any made in Germany, or any other European country; it has greater capacity, and in thrashing and cleaning grain will do nicer work than the best German machine. These machines are fitted with every attachment demanded in foreign countries. What is said of the lightness, capacity, and economy of the American thrasher may be said with truth of our portable and traction engines, mowing machines, binders, plows, cultivators, &c.

So many practical machines are invented and put on the market, every week, almost, in America that it is difficult to keep run of them. Some have never been seen in Germany, even by wealthy proprietors who carry on an immense scale and profess to keep a sharp watch for improvements of importance to them. I believe there

farmer must be convinced of is that American-made machines are durable. Everything made here is clumsy and heavy, and the idea is that it must be so in order to be durable. The farmers hear and read a great deal about the lightness of American machines and the rapidity with which they work, but they are quite uninformed as to their durability.

A young Saxon, who was born and spent most of his life in this rather behind-the-time section of it, went to the United States not long ago to "grow up with the country." He secured work in the city of New York as a clerk in an importing house, but it was too much of a strain upon his system, which for twenty years had been used to the easy-going ways of Saxon living. Within six months from the date of his departure he was back in his beloved Saxony again, and being asked why he had not remained longer in America, his answer was (if I may be allowed a free translation), "It was too — quick for me over there."

That is the idea many Germans have of the United States and everything American—"too — quick." They like to export their own products to the United States, and they do export them to the value of many millions of dollars annually, and their export trade is increasing rapidly. The American quickness in knowing a good thing when it is seen and buying it, especially when that thing is of German manufacture, they by no means object to; but no matter what may be said and written to the contrary, there is in the German mind an underlying suspicion of American productions which he cannot all at once get over. He reads of trains being run 100 miles without a stop; of people traveling across a great continent in eight days, living all the while luxuriously and only twice changing cars; of trains breaking through brand-new bridges or running off from one that had just been carefully inspected, then taking fire and roasting passengers to death; of toboggans that are sped for pleasure at the rate of 3 miles a minute; of boats that are sailed on ice almost as fast; of horses that trot a mile in two minutes and ten seconds, or less, and of other things, all surprising and some shocking, and his comment is like that of the Saxon youth who tested life in New York—"too — quick."

So, my friends who make the best agricultural machines in the world, if you would build up a large trade in Germany and in Saxony, take practical steps to show the farmers that your machines have other merits besides lightness and speed, capacity and economy—four excellent qualities. Show them that they are durable.

GEORGE B. GOODWIN,
Consul.

UNITED STATES CONSULATE,
Annaberg, Saxony, March 17, 1887.

FARMING STATISTICS AND LAND INDUSTRIES IN THE DUCHY OF SAXE-ALTENBURG.

REPORT OF CONSUL MILLAR.

The extent of cultivated land in the Duchy of Saxe-Altenburg.

plants for fodder. Among the fodder plants clover is the most important, covering no less than 7,169.6 hectares. Potatoes are planted in 7,948.7 hectares, red beets in 3,229.6 hectares, and sugar beets in 545.5 hectares; winter rye is grown in 16,162 hectares, oats in 14,726.1 hectares, summer barley in 8,351.9, winter wheat in 5,779.2 hectares, summer wheat in 1,167.8 hectares, summer rye in 716.7 hectares, vetches (a species of pea) in 636.8 hectares, peas in 595.1 hectares, beans in 94.2 hectares, lupins in 11.7 hectares, and winter barley in only 2.8 hectares.

The fertility of the land is shown by the fact that grain produced amounted to 729,449 double cwt.;* pod fruits, 12,590 double cwt.; potatoes, beets, &c., 2,074,519 double cwt.; rape, 18,895 double cwt.; clover, lucerne, &c., 1,065 double cwt., with a middling harvest. The grain yielded 957,687 double cwt. straw, the pod fruits 17,549 double cwt. dry fodder, and the hay and aftermath 388,065 double cwt. Of fodder straw 376,165 double cwt. was produced.

The total of domestic cattle in the Duchy is given as 149,148, made up as follows: Horses, 8,921; oxen and steers, 9,487; goats, 14,121; sheep, 23,325; hogs, 39,581; cows, 53,713. These are divided as follows: Eastern division: Horses, 6,641; oxen, 5,899; goats, 4,820; sheep, 6,185; hogs, 23,092; cows, 37,971; total, 84,608. The remainder: horses, 2,280; oxen, 3,588; goats, 9,301; sheep, 17,140; hogs, 16,489; cows, 15,742; in all, 64,540—belong to the western division.

The excess of sheep and goats in the western division is explained by the greater extent of pasture land, which enables every peasant to keep a few sheep and goats, whereas these animals in the eastern district are only kept by the larger farmers.

For the same reason the eastern district is richer in horses and cows, which are there extensively used for plowing and agricultural operations.

To improve the breed the local agricultural societies are now introducing cattle for breeding from the Alps, previous experiments in that direction by individuals having turned out satisfactorily.

Fruit is an important factor in the income of the Altenburger farmers and peasants. Every village is surrounded by carefully cultivated orchards, and along most of the roads fruit trees have been planted, which in coming years will yield rich crops. It is reckoned that there are about 1,000,000 fruit trees in the Duchy. Half of these are plums and damsons (*Zwetschen*), 150,000 apples, about the same number of cherries, 100,000 pears, and about 5,000 walnuts. A poor harvest yields 50,000 double cwt., a good one 100,000, and a rich harvest more than 200,000. The income of the Duchy from its orchards is consequently very considerable, even when prices are depressed. Reckoning the double cwt. of pears at 4.20 marks (1 mark = 23.8 cents), apples 7.30 marks, plums 7.20 marks, cherries 12.70 marks, walnuts 24 marks, a good harvest yielded as follows:

Kind.	Number.	Yield.	Value.

The improvement of the culture of fruit is watched over by the Society for Fruit Culture, one of whose objects is the introduction of winter pears, which bring a higher price in the market than the earlier varieties, which will not keep.

An important branch of industry is the production of *Braunkohlen*, a sort of peat, for fuel. The diggings are chiefly in the eastern district, and are both underground and surface. There are forty-nine such diggings in the eastern district, and the output last year was 827,955 tons,* an increase of 6,952 tons on the previous year. The output brought 1,527,190 marks; 769,276 tons were sold outwards; the remainder was consumed in the Duchy. In the western district there are only three diggings, which produced 1,215 tons. The total number of persons employed in the diggings is 1,263, viz: 514 men underground, and 608 men and 141 women on the surface.

An interesting development of a subsidiary industry, the manufacture of wooden shoes, is also reported from Schmoelln. Wooden shoes have, up till now, never found much favor, owing to their ungainly appearance and the clattering sound they produce. A factory has, however, been recently erected in Schmoelln which devotes itself to the manufacture, by machinery, of a superior class of wooden shoes, faced with india-rubber or leather, so that they make no noise, and to the unpracticed eye are indistinguishable from ordinary leather productions. These new shoes are said to find an extensive sale not only in Germany, but in other countries, particularly in the north of Europe.

SAM'L ROLFE MILLAR,
Consul.

UNITED STATES CONSULATE,
Leipsic, February 25, 1887.

THE GERMANS IN EAST AFRICA.

REPORT OF CONSUL GOODWIN.

The number of stations and agencies thus far established by the German East African Society is 13, and the following particulars concerning them, recently made public, may be of interest to many Americans:

No. 1.—Chief depot at Zanzibar, founded by Dr. Carl Jühlke in December, 1884. Here are located the headquarters of the society, and are stationed the general manager, Government architect Hörnecke, and a local manager, Herr Rühle.

No. 2.—Simaberg, an experiment station founded in January, 1885, by Count Pfeil, and enlarged and for some time in charge of Herr Schmidt, a practical gardener. At this station are a steward, Herr Nielsen, and about 25 day laborers under the direction of the steward. A large stone house for the use of the steward and visitors has been erected and a number of smaller houses and stables. At this station all the tropical and European fruits and nuts are raised in abundance, and tobacco of good quality.

No. 3.—Kiora in Usagara, near Simberg, founded by Herr Söhne in June, 1885, now in charge of a native day laborers.

No. 4.—Ealule, in Somaliland, not far from Cape Guardafui, founded by Herr Winter in 1885, now under his charge, not yet much developed.

No. 5.—Dunda, in Usaramo, on the Kingani, founded by Lieutenant Kreuzler in 1886. There are now stationed there the lieutenant in charge, a chief gardener, superintendent of plantation, a blacksmith, and about 60 laborers, employed by the day. A store, several houses, stables, and a blacksmith's shop have been put up. About 170 acres have been planted to rice, maize, potatoes, sugar, cotton, and tobacco.

No. 6.—Madimola, in Usaramo, on the Kingani, founded in 1886 by Lieutenant (Baron) St. Paul-Illaire, and now occupied by him, a head gardener and engineer, 30 to 40 laborers employed, and 32 acres planted in tobacco, cotton, rice, and maize.

No. 7.—Korogwe, in Usambara, on the Pangani, founded in 1886 by Lieutenant (Baron) von Gravenreuth. A large area devoted to maize, bananas, cocoanuts, beans, and potatoes.

No. 8.—Usaungula, on the Kingani, in Usaramo, founded by Lieutenant von Zelewski, Herr Graham, and Lieutenant von Bülow; 30 men employed, and 50 acres planted in cotton, tobacco, beans, &c.

No. 9.—Petershöhe, near Mbusine, in Useguha, founded by Lieutenant von Anderten, in 1886, and employing two head farmers and 35 laborers. Crops, cotton, tobacco and bananas.

No. 10.—Bagamoyo, in district of Zanzibar, on the coast, founded by Lieutenant (Baron) von Bülow, in August, 1886.

No. 11.—Tanganizko, on the Kilesi, in Girinama, a station of much trade importance, founded in 1886 by Lieutenant von Anderten, and occupied by him and three assistants.

No. 12.—Hohenzollernhaven, on the Wubuschimündung, established by Herr Janke, and to be in charge of Count Pfeil, assisted by Lieutenant von Baerensprung, Dr. Spuhn, an agent and superintendent. This station is expected to become of considerable importance as a trading center.

No. 13.—Masi, on the Pangani, in Usambara.

GEORGE B. GOODWIN,
Consul.

UNITED STATES CONSULATE,
Annaberg, March 21, 1887.

MERCHANT MARINE OF GERMANY.

REPORT OF CONSUL FAY.

According to the official statistics of the German Empire, the number of sailing vessels on January 1, 1886 (no later date mentioned), sailing under the German flag was 3,471; of these 1,688, or 48.1 per cent., were in service, whereas in 1881 only 34.5 per cent., or 1,199, were in service; of the remain-

In the year 1885 there were launched 10 sailing vessels of 10,729 register tons; 1 full-rigged ship of 1,506 tons, and 8 barks of 8,192 tons, whereas only 14 smaller vessels were built, with a total of 1,624 register tons.

The building of steamships was limited in the same year to 23 screw steamers, with a total of 10,081 register tons, and 4 paddle steamers of 697 tons. This shows plainly that the measurement of the newly-built sailing vessels exceeds that of the screw vessels which were constructed in the same year.

The considerable saving of large ships in the number of the crew is shown by the following table:

Capacity of vessel (registered tons).	Sailing vessels.	Steamers.
	One sailor required for each—	One sailor for each—
30 tons	11.1 tons	4.1 tons.
30 to 50 tons	14.4 tons	7.7 tons.
50 to 100 tons	16.7 tons	9.5 tons.
100 to 200 tons	22.7 tons	14.6 tons.
200 to 300 tons	28.9 tons	19.8 tons.
300 to 400 tons	32.5 tons	25.8 tons.
400 to 500 tons	35.7 tons	30.2 tons.
500 to 600 tons	39.3 tons	33.2 tons.
600 to 800 tons	43.9 tons	37.4 tons.
800 to 1,000 tons	52.3 tons	41.5 tons.
1,000 to 1,600 tons	60.3 tons	39.5 tons.
1,600 to 2,000 tons	66.5 tons	28.3 tons.
2,000 tons or over	72.1 tons	25.4 tons.

According to this statement about 9 sailors are requisite for a sailing-vessel of 200 to 300 register tons, but a vessel five times the size, namely, 1,000 to 1,600 tons, does not require five times as many men, only 22 being the required number.

If one considers the savings of large vessels in the crew, in the construction of the hull, in the rigging, repairing, &c., it is explainable that in our time of low freight rates these large vessels still leave a profit and, in consequence of it, the building of them has not ceased, notwithstanding the large number already in existence, but is still going on.

The large vessels, as already stated, pay a small percentage on the present rates of freight, whereas the smaller ships cannot compete with them without being the losers, and at the present time there is no probability of an advance in the tariff, which is poor consolation for ship-owners.

Should there be an advance, the cargoes would rapidly decrease, partly because a great many goods cannot bear a higher cost, and partly because the railways are constantly on the lookout to increase their traffic, as they are now, with the present rates, dangerous competitors.

ANDREW F. FAY,
Consul.

UNITED STATES CONSULATE,
Stettin, March 25, 1887.

GERMAN HOP CROP FOR 1886.

REPORT OF CONSUL BLACK.

Nuremberg is the center of the hop trade of Europe, and is probably the largest market in the world for this article of commerce. There is large capital invested, and the store-houses are very extensive, containing all the necessary machinery for curing the hops and putting them into merchantable shape. The chief mart is situated in the center of the city, and there are three market days per week, Tuesdays, Thursdays, and Saturdays, but during the active season, from the 1st of September to the 1st of January, large transactions are completed every day. The goods bought and sold are not confined alone to the Bavarian brands, but include those of all the German states together with the Bohemian varieties.

Quotations are, as a rule, made for 50 kilograms, a German hundred-weight, or about 110 English pounds, for cash and without discount.

The weather during the early summer months of the last year was very unfavorable for a large yield, in fact fears at that time were entertained that but a small crop would be gathered; but the month of August proved so propitious with its warm days and nights that the quantity was brought up to about that of the preceding season in a majority of the districts, but the quality was somewhat injured by the very rapid growth the weather engendered.

The early reports concerning the crop in England were very favorable, but the harvest being late, the fruit, before it was gathered, was much injured by frost. While in the United States the situation was entirely changed from the previous year, and instead of having, in quantity and quality, the best crop of all hop-growing countries, it had, in the principal hop-growing sections, an entire failure.

If the harvest had turned out equally as good in all other countries as it did in Germany, it would have proved, perhaps, impossible to have found an outlet for the large amount of hops offered for sale in this market, but the wants of the United States were large, and it took from Nuremberg, during the year 1886, hops to the value of \$1,900,955.80, or \$1,629,650.13 more than in the year 1885. With such a customer, prices for the best brands were well maintained during the entire season, without the usual fluctuations, and show at the present time a slight improvement by reason of scarcity; but the poorer qualities have been very much neglected, and quotations extremely low, English buyers being the only ones who appear to want them.

Overproduction continues to be the general complaint, and one can appreciate how reasonable it is considering that this year Bavaria alone has over and above her wants an amount equal to about three times the amount reported consumed by the United States in 1886.

WM. I. BLACK,

GERMAN HOP CROP FOR 1886.

435

Quotations of the leading brands in the Nuremberg market for the following months.

PRODUCTION OF COAL IN RUSSIA AND GERMANY.

REPORT OF CONSUL FAY.*

In Russia a further rise on the duty of iron is impending, and the owners of the Donetz coal mines have also the prospect that further taxes will be imposed on foreign coal.

The output of Russian coal in 1860 amounted to 10,000,000 poods, or 164,000 tons, whereas it increased in 1885 to 262,000,000 poods, or 4,360,000 tons, of which the Donetz district mined about 2,000,000 tons, the district of Perm 250,000 tons, Poland 1,300,000 tons, Moscow about 500,000 tons, and the balance in the Killo district.

Notwithstanding the enormous increase, the production of coal in Russia only amounts to $\frac{3}{10}$ of 1 per cent. of the total output of the countries named below.

According to Mr. Radzig's report, the production in 1885 in the several countries was as follows:

Countries.	Production.	Per cent.
	<i>Tons.</i>	
England.....	290,666,600	40
United States.....	204,919,950	28.2
Germany.....	130,073,304	17.9
France.....	34,153,322	4.7
Belgium.....	31,973,324	4.4
Austria-Hungary.....	30,519,992	4.2
Russia.....	4,360,000	.6
Total.....	726,666,492	

It will be seen by the above figures that the output of the United States, with its immense area of coal fields, falls far below that of England.

PROTECTIVE DUTIES IN RUSSIA.

By so small a production of coal in Russia one would think that it is a staple article, and that the mines in the Caucasus, in the Ural, in Siberia, Turkestan, &c., could be advantageously worked; but such is not the case, as the output of the Donetz basin of 2,200,000 tons, which consists of nearly 40 per cent. of anthracite, partly remains unpurchased. In the years 1883 and 1884 15 per cent. of the output remained unsold; nevertheless several million fathoms of wood are annually burned.

In order to stop the importation of English coal a duty of 2 copecks† per pood in gold was petitioned for and granted for the ports of the Black Sea, and one-half copeck per pood for the ports of the Baltic; but this had not the desired effect. The English coal could not be displaced, and a higher duty was necessary. Three copecks were granted for the Black Sea ports; but even this duty does not displace the English coal from these ports. Now it is proposed to further raise the duty to 3½ copecks for the Black Sea ports and 2 copecks for the Baltic. Probably

greater than is the case in the last-named countries. Russia is still very backward with its technical contrivances in mining.

Mr. Radzig is of the opinion that a further advance in the duty on coal for the ports of the Black Sea would be detrimental to agriculture in the south. Respecting a higher duty for the Baltic ports, the consumption of coal at Moscow would decrease rapidly.

At the present prices of 22 to 23 copecks per pood the consumption of coal at Moscow does not exceed 10,000,000 poods, as many manufacturing industries burn wood, and a higher duty would compel all other industries to use the same fuel, while the Donetz coal-owners would certainly not profit by it. Moscow, with surrounding country, consumes annually about 1,000,000 fathoms of wood, equal to 100,000,000 poods of coal, and the Donetz district could not only supply the manufacturers, but also the owners of houses as well, if coal could be had at reasonable prices, but high prices would induce none to make a change.

English coal, which is far superior to the Donetz coal, is difficult to place at 22 to 23 copecks, whereas Donetz coal at these prices would find no purchasers if an increased duty should be granted.

In order to augment the sales of the Donetz coal the construction of a railroad is contemplated, which will be about 60 German miles in length, the estimated cost of which is 22,000,000 rubles. Mr. Radzig is of the opinion that this road will have neither freight nor passengers to transport, and that the sale of the Donetz coal can only be augmented by the projected canal which is to connect the Azov with the Black Sea. He writes that this canal will be built by a French corporation, with a capital of 25,000,000 rubles. The Azov is very stormy, and is only navigable about sixty days in the year, this being the reason that the cost of transportation of coal from Marinpol to Odessa or Nicolajeu is high, namely, 5 to 8 copecks per pood.

The transporting of coal from Marinpol by canal would probably not exceed 3 to 4 copecks per pood, which would enable the Donetz coal to compete with the English coal.

Mr. Radzig writes that the Donetz coal, because of its bad quality, will never be able to compete with the English article at the Baltic ports, and that only by reducing the railroad freights will it be possible to open up larger markets for it.

Proprietors of coal mines are petitioning for higher duties, but they forget that thereby they ruin other industrial establishments, and that it is forsooth not the task of a government to allow one industry to be benefited at the cost of another, which would be the case if a further duty should be placed on English coal shipped to the Baltic ports.

Russia has two large manufacturing centers, namely, Poland and Moscow, with surrounding districts. The former has good coal in the vicinity, which is mined mostly by Germans. The latter uses wood, or the dearer and worse Donetz coal. The English coal cannot be obtained, because of the high railway rates and the increased duty.

The quality of German coal in some respects is better than the English, particularly the Silesian product, which is considered in every respect superior. However, some mines produce coal of very poor quality.

There is no duty on foreign coal, but a bounty of 3 marks per ton is allowed on all coal exported.

Coal-miners receive from 2.50 to 3 marks per day, with no allowances excepting fuel. Even at these small wages the owners are not troubled with the so-called "strikes"; such a thing is not known. However, they are not satisfied with the pittance they receive for the hard labor, and may show their dissatisfaction in the near future, as they appear to have some sympathy from the coal merchants and others interested in that industry. For instance, I questioned one of the largest coal merchants of Stettin in relation to "strikes." His answer was, "Unfortunately, the coal miners of Germany never struck, although they had sufficient reasons for it if they chose to do so."

ANDREW F. FAY,
Consul.

UNITED STATES CONSULATE,
Stettin, March 21, 1887.

TIN-PLATE TRADE OF SOUTH WALES.

REPORT OF CONSUL JONES.

It is well, perhaps, to point out that for several years past there has been more money lost than made in the tin-plate trade in South Wales. Out of an average of eighty-two works in existence during recent years there have been no less than forty failures; and of the four works named in the Department's circular, namely, Machen, Pontymister, Pontnewydd, and Rhiwderin, three, namely, Machen, Pontnewydd, and Rhiwderin, have failed and are now standing idle. Moreover, the works at Machen and Rhiwderin have come to grief twice during the last five years.

There are a large number of tin-plate works in this district, and the area covered by the various manufactories average from 2 to 10 acres. The materials out of which the buildings are constructed are stone and bricks, with roofs made partly of stone and partly of pantiles. There are no puddling-furnaces in any of the new works, and hence no refining fires or hollow fires.

The principal material now used in the manufacture of tin plates is Siemens and Bessemer steel. Manufactories working the Bessemer material are situated at Barrow, Dowlais, Ebbu, Vale, Tredegar, Rhymney, and some other places. But the larger works, using the Siemens steel bars, are grouped around Swansea. There are, moreover, three large steel works making bars for tin plates on the Siemens principle in that district.

The number of mills in each manufactory averages from two to ten, and the average weekly output of each engine *generally*

TIN-PLATE TRADE OF SOUTH WALES.

sons employed is about 90 per mill. The total amount of wages paid in the works of three mills would be from £9,000 to £9,500 a year. Siemens-steel bars are a little dearer than the Bessemer-steel bars, but not very much; the difference is about 5s. or 10s. per ton. And the price of iron, again, is a little lower than steel bars; the difference, however, is not considerable.

EVAN R. JONES,
Consul.

UNITED STATES CONSULATE,
Cardiff, March 1, 1887.

Tin and terne plate manufactures in South Wales.

[This table is based on 100 boxes, as per brand mark, 14 by 20.]

Articles.	Weight.			
	Tons.	Cwts.	Qrs.	Lbs.
Weight of bars, 14 by 20:	5	17	2	12
Iron	5	17	2	12
Steel		4	0	0
Waste reducing bars to sheets by oxidization and pickling		17	0	0
Waste by scrap		2	2	20
Yield of tin, 100 boxes bright		1	1	10
Yield of tin and lead each, 100 boxes ternes	7	10	0	0
Coal and coke		7	0	16
Vitriol, black and white pickling		1	0	2
Palm oil				

Bran, 1d. per box; boxes (wood), 4d. each; annealing pots, $\frac{1}{2}$ d. per box; machinery, wear and tear, rent and taxes, management, &c., and office help, 2d. per box.
The weight per box is as follows:

	Cwts.	Qrs.	Lbs.
IC	1	0	0
IX	1	1	0
IXX	1	1	21
IXXX	1	2	14
IXXXX	1	3	7
IXXXXX	2	0	0
IXXXXXX	2	0	21

The extra cost in working IX is the cost of bars used in excess of IC. For instance, IX requires one-quarter of a hundred-weight more than IC. Up to IXX workmen's wages are the same as IC; after IXX the wages are doubled.

Wages paid in the manufacture of tin plates in mills and tin-house.

Occupation.	Wages per 100.			Wages per 100.
	£	s.	d.	
<i>Mills.</i>				
Roller, 3s. 5d. per dozen	1	8	6	8 4
Loublor, 2s. 9d. per dozen	1	2	11	6 6

<i>Tin-house.</i>				
Grease boy, 1d. per box				
Rubbing				
Dusting				
Assorting				
Reckoning and weighing				
Boxing				
Laborers				
Engineer (see above)				

The same wages are paid in all, or nearly all, the works in this district, as the workmen belong to the union, or Tin-Plate Workmen's Association. There is some difference in the first hands, such as roll-turner and tin-house overman. I have not been able to get the exact sum paid at any one particular works throughout; but these are the ruling prices in all the works in my district. The explanation of one works paying and the other not paying is to be found in the management and construction of the works, and also in the brands, &c. The cost of wages per box amounts, at the present day, to 2s. 4d., very nearly.

Cost of manufacturing 1,500 boxes C, 20 by 14.

WHITE LEAD MANUFACTURE IN BRISTOL.

REPORT OF CONSUL LATHROP.

WAGES.

There is in the west of England but one plant for the production of white lead proper; by which I mean the carbonate, produced by the ancient Dutch process. It is unnecessary for me to enter into any detailed description of so well known a process, so I will only mention that the appliances in this particular works are all of a very old type, and that a proportion, that would be unusual in the United States, of the work is done by hand labor. Wages nominally are 58 cents per day, but a system of piece-work prevails, which differs from those in use elsewhere, and which is claimed to be advantageous for both employer and laborer. A day's work for four men is held to be the setting of one complete layer of each of the materials that enter into the stack, viz, the tan, the acid, the lead, and the flooring. If three men set a

WHITE LEAD MANUFACTURE IN BRISTOL.

in this deleterious occupation. In the grinding and other departments day wages are paid, averaging all round, including the stackers, \$4.85 per week. It is this cheapness of labor which has prevented the utilization to a larger extent of mechanical methods.

COST OF PRODUCTION.

On an average, it is found that 18 cwt. of pig lead will produce 1 ton of white lead. Pig lead in this market is to-day worth \$65 per ton; hence there is metal to the value of \$58.50 in a ton of white lead, while the expenditure for acid and tan amounts to about \$2.16, and for taxes to 48 cents. The interest on capital invested in plant and on that idle during the completion of the slow process of manufacture approximates \$3.90 per ton of white lead, and the expenditure for labor is about \$8.84. Other expenditures, including renewal and depreciation of plant, cost of barrels, &c., amount to about \$4.10 per ton of white lead, though this includes nothing for salaries, as in the particular case under consideration the firm have a large staff of assistants engaged in other branches who attend to the white-lead business. The following recapitulation shows approximately the prime cost of a ton of white lead in Bristol:

Metallic lead	\$58 50
Acid and tan	2 16
Wages	8 84
Interest	3 90
Taxes	48
Other items	4 10
	77 98

These figures are presented with some diffidence, as they do not purport to be more than a rough statement.

The price of white lead, unground, is about \$80 per ton, so that there is little or no margin at present prices.

SOURCE OF MATERIALS.

The cheapness of spent tan is a considerable advantage to the Bristol white-lead manufacturer, and, owing to the number of tanneries, there is a certain and abundant supply. The pig lead used comes either from Germany or else is domestic in its origin. It is essential, of course, to the quality of the product that the pig should be as nearly chemically pure as possible. The slightest trace of copper or silver will seriously deteriorate the white lead. The British and German smelters being in advance of other nations in the practice of their art, their product is largely used by European white-lead makers. For purity the most regular and certain of the English pigs are held to be the W. B. and Snail Beach. These rule something above ordinary prices, and, particularly W. B., are hard to get at present. The metal corroded in Bristol is mostly smelted in Bristol, and comes, or a considerable part comes, from

sale dealer; but the grinder is obtaining each year less of this intermediate business, and the manufacturer is selling more and more of the ground stuff. Dry white lead is worth to-day about \$80 per ton. Pure white lead ground in oil sells for about \$100 to \$110 per ton, with ninety days' time to an unexceptionable buyer. From this maximum price the stuff can be sold down to \$50 per ton; the difference in price simply indicating the increased proportion of sulphate of baryta or heavy spar that is introduced. Barytes has no body. On the other hand it absorbs no more oil than the lead, nor does it change color, nor does it, like other adulterants, reduce the coloring matter of the lead. Hence, when not intermixed in excess, it can perhaps hardly be called an adulterant, and some grinders introduce a small percentage into all their white lead, averring that a ton of the mixture at \$95 will accomplish all that a ton of the pure at \$105 can do. This seems to be the only substance generally used to mix with white lead; though it is certain that if a buyer demanded white lead of the grinder at, say, \$50 the ton, there would be considerable whiting in the mixture. But any buyer who pays a fair price can get a fair article, and if he pays a high price he can get a pure article. The different grades of white lead on the market are indicated simply by numbers; No. 1 being pure, No. 2 having a small proportion of barytes, and so on down to No. 5, there being as a rule five grades on the market. The thousand and one fancy names sometimes used to indicate the different grades are unknown here.

THE LEWIS-BARTLETT PROCESS.

The American "Lewis-Bartlett" process for subliming lead has been within the past two years introduced into Bristol, and there is a considerable production of pure sulphate and oxide of lead which seems to be a satisfactory substitute for the carbonate, though it meets with considerable criticism. It is charged against this new pigment by practical painters, first, that it is off-color and has a yellowish tinge; second, that the body is not equal to that of the carbonate; third, that it requires more oil; and, fourth, that it will harden under water, or if not covered by water will absorb moisture from the atmosphere and harden. These complaints were made by several, and I communicated them to the secretary of the new company, who answered:

One must always allow for a degree of prejudice. I have many times proved that in color we fear no one. A thorough, and, at the same time, a *scientific*, test for covering will disprove what they say. As to its requiring more oil, I think there is some mistake here. A painter when he receives the lead in "paste" will find it does not require quite as much oil as English lead. In some instances it does harden under water, but it is no difficulty to keep it under oil. The lead-colored lead is particularly suited to all classes of iron work, as no acid is used in manufacturing and the fear of setting up rust is done away with.

The works of this new company are advantageously situated a few miles from Bristol, having direct railway communication with the interior, and also by water both with the interior and with the ocean. It is not necessary for me to give any detailed description of a process well known in America, and therefore I pass on to the product. Whether from prejudice or because the outturn is really inferior, the new company has not been able, so far as I can see, to remunerate its

WHITE LEAD MANUFACTURE IN BRISTOL.

the present depressed price and comparative dullness of the trade, it seems unlikely that we could offer such advantages as would encourage an export trade to this port in this commodity.

LORIN A. LATHROP,

The amount of lead obtainable in smelting has been reckoned as 95 per cent. of the amount indicated by the dry assay; thus, in the case of an ore containing 80 per cent. of metal by dry assay, the actual yield has been taken at 76 per cent.

In calculating the quantity of silver obtainable from lead ores the amount of silver in ores containing less than 3 ounces silver per ton of ore has been omitted, as in most cases it is not extracted; and it has been assumed that, on an average, one-fourth ounce silver remains in each ton of desilverized pig-lead.

Quantity of lead produced in the United Kingdom, the quantities imported and exported, and the amount left for home consumption in 1885 and the previous years.

MANUFACTURE OF WHITE LEAD IN VENICE.

REPORT OF CONSUL JOHNSON.

HISTORY.

In a report on the state of trades and industries (*arte e mestieri*) of the city of Venice, presented in the year 1773 to the *consiglio* on board of trade (*deputazione*)

446 MANUFACTURE OF WHITE LEAD

Later on, in 1840, Pietro Bizagho, of Venice, established a factory of some importance and at great expense, adopting processes already tested and improved in other localities. He employed about 45,000 kilograms of lead imported from abroad and 125,000 kilograms of sulphate of barium from Bergamo and the Tyrol. In a short time, however, he was constrained to abandon the undertaking, finding that he could not sustain the competition of factories already established in Carinthia. The process first employed was that of bending plates of lead into a

The process first employed was that of bending plates of lead into a spiral in such a way that about 1 inch of space remained between the circumvolutions. These spirals were then placed vertically in vases containing strong vinegar. This when exposed to a moderate heat gave off an acetic vapor which attacked the surfaces of the spiral plates and gave a rapid oxidation. The oxide (carbonate) of lead thus obtained was broken up into small cones, and after being fired by exposure to a white heat of commerce.

The method in use afterward, that is, when the manufacture existed in Venice in 1840, was to form the lead into broad thin sheets by casting it when melted into molds which gave it the proper shape and a scaly surface. These sheets were then inclosed in wooden cases and placed over basins containing a stratum of withered and decayed grapes, called "*cibibo*" moistened with a little water. This moisture, when exposed to the heat of stoves properly disposed, sent its acetic vapor into the cases already mentioned containing the leaden plates, and arranged on cords, as articles from the wash are hung out to dry. In these cases, after being hermetically closed for about three months, the oxide (carbonate) of lead was collected, care being taken that in falling it should not amalgamate with the mass of grapes below. The oxide of lead was then mixed with sulphate of barium and a little gum arabic in other vessels in which were prepared the various qualities of white lead known in common here as the "Dutch," "Genoese," "Venetian," &c.

The quantity of white lead produced annually when it was fabricated here, *i. e.*, after 1840, averaged 82,103 kilograms. Before that epoch it is impossible to form a reliable estimate of the annual production, the importance of the factories being unknown.

There exists at present no manufacture of the article either in the city or province of Venice.

MARKETING THE PRODUCT.

city or province of Italy.

MARKETING THE PRODUCT.

A market for white lead does not now exist in Venice. It is found only in localities where the article is produced, as Genoa, Naples, &c. It is dealt in, however, by the color merchants.

The fabrication of white lead was limited to the production of its several grades of powder. It was also, as at present, ground

The fabrication of white lead was limited to the production of its several qualities in cones and in powder. It was also, as at present, ground in oil or water, or unground. White lead, as already stated, was manufactured of different qualities, and was recognized as distinct in commerce, with characteristic names. There is first

The fabrication of white lead is made in several qualities in cones and in powder. It was formerly used in oil or water, or unground.

White lead, as already stated, was manufactured of different qualities; of these eight are recognized as distinct in commerce, with characteristics varying according to the mode of preparation. There is first pure white lead: then silver or Kremser white, which is the pure white lead mixed with

Genoa; "Dutch" (*d'Olanda*), that of Holland, &c., and at present the name varies according to the origin and amalgamation of the article.

RAW MATERIALS.

The lead was obtained from Spain and Carinthia, the sulphate of barium from the quarries in the neighborhood of Trent and Bergamo. The grapes came from the Levant, and the small quantity of gum arabic was easily obtained in Venice. The prices of these materials in Venice, exclusive of precedent duties, are as follows:

	Per quintal.
Lead (pig)	\$8 00
Sulphate of barium	1 60
Dried grapes (decayed)	11
Gum arabic	50

The customs duties on the same material coming from abroad are:

	Per quintal.
Lead (pig and fragments)	\$0 10
Sulphate of barium	20
Dried grapes (as fruit)	2 00
Gum arabic	free.

The wages of a laborer (when the manufacture existed) was from 35 to 40 cents per day. No reliable information can be obtained concerning the product per laborer and cost of labor per unit.

So far as can be ascertained no American white lead is for sale in this market, nor has it ever been an article of import.

American white lead might be introduced here provided that for price and quality it should be found preferable to the Italian product after paying the cost of transportation together with a general and conventional customs duty of 5 francs or 96.5 cents per quintal.

H. ABERT JOHNSON,
Consul.

UNITED STATES CONSULATE,
Venice, March 15, 1887.

COCA.

REPORT OF CONSUL DU PRÉ.

I have seen so much recently written of coca in newspapers and in medical publications, that I am impelled to report what I have learned of the virtues of this product of South American forests. With leathern straps passing around their foreheads to sustain burdens of 150 or 200 pounds on their backs, I find these lithe, slender natives traversing plains and mountains with greater celerity than the mule I bestride, which travels through the livelong day 6 miles an hour. Native physicians, *élèves* of the schools of Paris, France, concur in assuring me that this extraordinary capacity for endurance of toil and hunger is to be ascribed to the use, by these *viajeros*, of coca. These learned gentlemen say that the coca of the medical dispensary is the coca of the

the original inhabitants of all these tropical countries, though its consumption is greatest in the equatorial regions of South America. It is deemed indispensable to his well being by every Peruvian. Recently the medical profession in all countries has been induced to study the strange and unique properties and effects of coca. A peculiar force producing nervous insensibility, distinguishes coca when used as a kaloid. It is administered freely to infants, and is the chief intoxicant of men and women. Youths through many days are intrusted with the care of valuable flocks of llamas, having no other sustenance than that to be found in little leathern purses containing coca and its compounds. Indians chew it constantly. Theirs, like the maxillary movements of tobacco-chewers, are incessant. From 30 to 50 graumas are consumed daily, serving, unlike tobacco, both as food and stimulant. Without coca habitual chewers cannot digest food; without it they are unable to ascend mountains, with long, rapid strides, never slacking their wonderful speed through the livelong day. They will not toil without it; without it they enjoy nothing; without it, practically, they cease to live. A traveler who has explored the mountains of Bolivia and Peru in search of gold and silver mines tells me that Indian postillions, using coca freely when driving pack-mules over the roughest roads along the Sierras, even when the "*sorocho*" prevails, outstrip well-mounted horsemen.

Most learned gentlemen, as well as miners from the United States and Europe, who have employed habitual coca-chewers in all descriptions of menial service, as well as in the mines of Central and South America, give unlimited credence to most wonderful stories told of the physical and nervous force and endurance supplied by coca. When, beneath a burden of 200 pounds, he must accompany a *caballero* 100 leagues; when he must watch many hours after fatigue and exhaustion; when an extraordinary expenditure of abnormal strength is required, the Indian only augments the quantity of coca that he consumes.

CHARACTER OF THE LEAF.

A perfect analysis, as I am advised, of the juices of this plant has never been made. Its principal element is the alkaloid "*cocoína*." The quantity evolved from a given volume, by weight, of leaves of the plant varies with the grade of development and with the state of dryness and mode of curing the leaves. It seems that more than 0.3 per cent. has never been obtained from leaves recently dried.

Its preparation for use is a very simple process. The leaves of the plant are dried rapidly in the sunlight and then subjected to moderate compression in the purses carried by the natives.

The delicacy of the leaves of this plant is almost abnormal, and in this consists the difficulty of preserving and curing them. In its brief harvest time, during the few hours the leaves are exposed to the sun, if rain falls on them they decay instantly, losing at once their volatile qualities, and are rejected by the Indians as valueless; and even after

filling the space between the interior and the exterior cases. Fresh and well preserved it has a color and taste *sui generis*. It is then deliciously aromatic, and delightful in odors it exudes, but when its life, its electrical force, perhaps, departs, it is horrible to the taste and its odors are nauseating. When coca, a few years ago, was used by the Indians alone, 10,000,000 kilograms were produced annually.

EFFECTS OF ITS USE.

The immediate effect of chewing coca is perfect insensibility of the interior of the mouth. The immediate sensation is that which one would experience when finding that his mouth had become a great void in somebody else's head. I had a dentist apply it when extracting the roots of a molar tooth, and the effect was as described. Indians constantly using coca finally lose the senses of taste and smell. They can eat, without repugnance, most disgusting food, and drink most nauseating drafts. The sensitiveness of the mucous membrane has been destroyed.

When one goes further, and swallows the saliva impregnated with the juice of the coca leaf, a delicious sensation of warmth and of perfect blessedness pervades one's whole being, intellectual, nervous, and physical, and he is lapped in the joys of an elysium.

Taken into the stomach it certainly retards digestion, but begets no inflammation, not even when used constantly. Its action, it seems, is restricted to the nervous system.

To this healthful action of coca upon the organs of assimilation of food or beverage, and to the chemical and nervous or electrical action of coca, physicians here ascribe the perfect soundness of the teeth of the Indian *coqueros*. The oldest coca-eaters have perfect teeth. Sadly worn away they may be, but caries, of which dentists prate so volubly, is unknown.

The Indian *coquero's* (coca-eater's) capacity to endure hunger, or rather the want of food, when furnished with coca properly prepared, is surely extraordinary. Perhaps it neither supplies nourishment nor appeases hunger. It seems rather, as a scientist states, to "silence the voice of hunger" and still the yearnings of the stomach. The nerves conveying to the brain sensations of hunger or of emptiness are stilled to perfect repose. The hollow voice of the void within is silenced; it is made inaudible. Dr. Morens says, "Coca deceives hunger. If the toiling *coquero* does not eat it is because he thinks he eats." In fact as soon as the influence of coca is exhausted and the supply wholly withdrawn the Indian eats ravenously. His stomach, unlike that of the sober drunkard after a terrible debauch, at once discharges its proper functions perfectly. Coca, it seems, only retards digestion and organic combustion.

In doses of 15 to 60 grains coca produces delightful intoxication. Its joys transcend in perfect blessedness all known human delights. A sensation of lightness first supervenes; the air inhaled is zephyrs from angels' wings; there are wild imaginings and fantastic hallucinations and gorgeous visions, and then complete insensibility. It is intoxication without drowsiness, without congestion of the brain, *is not* a sense of perfect rest. The

SUGAR INDUSTRIES OF BRAZIL.

induced a few Americans—white people—to test the virtues of coca as a substitute for whisky, and I am pleased to say they like it. In at least one instance, when taken in very large quantities, there followed great acceleration of pulse-beats and of respiration. There were convulsion of the muscles, persistent insomnia, suppression of thirst and hunger, and diminution of secretions of the skin and kidneys. When larger doses were administered painful sensations in the muscles ensued, itching of the skin, and feverish elevation of temperature.

It is the most potent nervine, almost, at man's disposal. Its hygienic properties are disclosed from its "physiological properties," says a Spanish M. D., who adds, that in hot infusion it is the one useful and healthful beverage one can use after dining. Especially is it commended to the feeble, to those who have transcended limits of sobriety in using alcohol. Its virtues should be tested, therefore, in inebriate asylums. It surely calms nervous excitability of many, and, taken in small quantities, enables one to endure cold and rain and snow, and it enables one to defy great fatigue and restores the forces lost by excesses. It is popularly used for indigestion, for disordered stomachs, for hysteria, flatulency, and colic, and all forms of intestinal disorders. It is used constantly by toilers in mines, and when one reaches the mines after marching several days through forests and over mountains, sustained alone by the use of coca and maize, he is permitted to eat at discretion through four days and have perfect rest. Then he is in perfect health and "fresh and fat," says the writer above quoted.

"*Cocaismo*"—habitual intoxication by use of coca—more easily becomes habitual and incurable than alcoholism or addictiveness to opiates. Its consequences, however, are not yet wholly measured or comprehended. Excessive and constant use of this intoxicant begets, rapidly, moral and intellectual degradation and decay; steady decline is interrupted at intervals by resistless impulses to do most violent and brutal acts. The nature of the father, as perverted by the drug, is transmitted to the child, and the inveterate vice, operating through generations, is said to account for the brutality of races of Indians, the Quichas and Aimaras of Bolivian fastnesses.

L. J. DU PRÉ,
Consul.

UNITED STATES CONSULATE,
San Salvador, February 26, 1887.

SUGAR INDUSTRY OF BRAZIL.

REPORT OF CONSUL-GENERAL ARMSTRONG.

I have before alluded to the precarious condition of the sugar industry of this country, and to the suggestion made in the Brazilian Chamber of Deputies by a prominent and influential member of that body, that to obtain from the United States a re-
compensation to reduce

some of the most prominent sugar merchants of this city), "the country is seriously threatened with the total ruin of its sugar industry." It was therefore resolved "to organize an association for the purpose of defending the important interests now in jeopardy," and I observe that one of the articles of the program of this association favors the policy of negotiating commercial treaties with sugar-consuming countries, and "especially a treaty of reciprocity with the United States for the purpose of increasing the consumption of Brazilian sugar amongst its population, since that Republic is in a position to become the principal sugar market of the world."

Brazil at present exports annually from 200,000 to 300,000 tons of sugar, corresponding to about one-fourth of the quantity consumed in the United States. It preserves vast tracts of land admirably adapted to cane culture, so that with remunerative prices and an adequate supply of labor, it could easily furnish all the sugar needed for our consumption beyond what is produced on our own soil, as it already supplies us with the greater part of the coffee which we consume. And, although the balance of trade is now largely against us and the increased consumption of Brazilian sugar would greatly augment the amount of our importations from Brazil, there can be no doubt of our ability to ship to this country merchandise at least equal in value to that which we would receive therefrom, if the Brazilian Government, to save its sugar industry from ruin, should admit our products on terms that will enable us to undersell our European competitors. This we hope to do finally in every case, but a commercial treaty, properly framed, would permit us to accomplish immediately that which must otherwise be the result of many years of toilsome and unremitting labor.

H. CLAY ARMSTRONG,
Consul-General.

UNITED STATES CONSULATE-GENERAL,
Rio de Janeiro, February 26, 1887.

THE ANNATTO BUSH.

REPORT OF CONSUL CLAYTON.

The name *Bixa*, which has been given to a genus comprising four species of tropical shrubs or small trees belonging to the natural order *Flacoustiaceæ*, is the native name of the Indians of Darien for one of the species, *Bixa orellana*.

The Brazilian name of the plant is *urucuara*, or plant bearing *urucu*, the latter being the Brazilian name of the pigment known as annatto. The name in *lingoa geral* is the same.

There are probably two species in Brazil, *Bixa orellana* and *Bixa urucurana*, the former being indigenous to the West Indies, but the two are very much alike and it is hard to say which species is grown in the Amazon Valley; probably both are found, but they resemble each other so closely that to the ordinary observer they are undistinguishable.

The species usually consid

in large bunches on the ends of the young branches. The fruit is heart-shaped, about an inch long, red or greenish yellow, according to the variety, and is covered with stiff prickles. When dry it splits in two, showing the seeds in a perpendicular row on each side. These seeds, which are very numerous, are embedded in a red, waxy pulp. I have never known the plant to be met with growing wild, though one often finds it many miles from any habitation, but it always marks the site of a former house or plantation.

The two species, or perhaps only varieties grown in Brazil, only differ in the color of the flower and fruit, which in the one are pink and red, respectively, while the other has white flowers and greenish-yellow fruit. The coloring matter seems to be of the same shade in both, and I have never seen any appreciable difference between the two kinds in the quantity produced.

The tree is cultivated in the whole Amazon Valley and is always seen around the houses of the Indians. It appears to attain a great age, but never becomes very large; the trunks of the largest I remember to have seen measured about 18 inches in diameter at the base. The wood is light and considered of no value. The tree is subject to no diseases, is not attacked by insects, and birds do not eat the seeds. It grows freely in any soil and no cultivation is necessary, except to shade and keep down the weeds around the young plants until they become well established. The trees must be grown in full sunshine, for if grown in the shade they do not bloom. Propagation is in Brazil effected only by seeds, and the trees begin to bloom when they attain the height of about 10 feet, which is in about three years from the time of sowing. In a cooler and drier climate, where growth would not be continuous, a far longer time would be necessary.

There seems to be nothing in the nature of the tree to prevent its being propagated by cuttings, which would probably root readily in bottom heat, and plants so obtained, following the usual rule, would flower and fruit much earlier than seedlings. The plants also sometimes form many suckers around the parent, making a dense bush with many stems; when this occurs increase could be had by separation, and, as the roots are numerous, fine, and fibrous, transplanting would probably be easy. In Brazil the fruit matures rapidly after flowering, and is ready to gather in about two months; if gathered as soon as mature the tree at once makes fresh growth, and flowers and fruits anew. The practice, however, is to allow the fruit to remain on the tree until wanted for use; it dries, and as the capsule does not readily burst the seeds remain long in good condition. Within a few months the tree is again in bloom, and usually one sees flowers and fruits mature and dry fruit on the tree at the same time. With the most care less culture two full crops can be gathered every year.

The preparation of the pigment is very simple. The seeds are macerated in water until the pulp, which is readily separated, is removed. The water is then passed through a strainer made of strands of palm leaves, and is then evaporated in the sun until the seeds and fiber, and is then rolled in leaves, producing

of it being so used on the Amazon. An infusion of the leaves drank hot is considered by the Indians a remedy for jaundice.

An American gentleman who has explored the Amazon Valley from Pará to Iquitos, Peru, informed me that he had never seen in any of his travels any systematic culture of the *urucu*, and very little of the said article comes to this market from the territory through which he has passed. He noticed that each house or village had enough trees for the use of its inhabitants, but as far as he observed there was no disposition to make the *urucu* an article of trade. There is a small annual export from Pará which I learn comes from the Igaripe-Meri, distant about a day's voyage from this city, where there were formerly some plantations, but at present there is very little attention paid to the culture, and the plantations are neglected.

The quantity of annatto exported to the United States from this consular district during the last two years amounted to 27,435 pounds, and valued at \$6,816.

ROBT. T. CLAYTON,
Consul.

UNITED STATES CONSULATE,
Pará, Brazil, March 16, 1887.

THE ANNATTO BUSH.

REPORT OF CONSUL VIFQUAIN.

The annatto (*Bixa orellana*), called by the natives *achiote*, grows spontaneously around here, but none is raised for exportation from this consular district. It has no marketable value here.

I have seen the plant, which is more of a shrub than a plant, since it grows from 5 to 6 feet high, and obtains a size of 4 or 5 inches in diameter at the stump. It is not wood, however; it is "fibrous." It bears constantly; the foliage and seeds fall off and grow again, all the year around and year after year. It seems to grow best in a sandy loam soil, but is not found above an altitude of 2,500 feet. Where it grows the temperature is never less than 70° F., and reaches 92° in the shade; in the sun, 130° F. In September last, at 12 o'clock m., I put my thermometer in the sun. It was 92° in the shade; in some ten minutes it reached 130°, and remained fixed at that point.

I have a cluster of seeds before me. Many clusters are found on the bush, and each cluster has some twelve pods, and each pod contains about twenty-four seeds. It is not as heavy as wheat, but heavier than barley. I should say it weighs some 54 pounds to the bushel. I am told that one bush furnishes very often one bushel, a most enormous yield considering the size of the seed.

The cluster of pods reminds one of a cluster of cockle-burs. It has the same color, but, unlike this pestiferous bur, it is not persistent in its adherence.

The annatto grows in a dry climate as well as in a moist one. It is at least it looks as well

THE ANNATTO BUSH.

to their quality. The Indians use it as a defensive armor against the frisky and still more pugnacious mosquito. They crush the seeds "and anoint their naked limbs with the stuff."

VICTOR VIFQUAIN,
Consul.

UNITED STATES CONSULATE,
Barranquilla, February 16, 1887.

REPORT OF CONSUL-GENERAL ADAMSON.

Annatto is not cultivated here, but is found in its wild state in all the coast districts of this Republic, and it is not an article of commerce here. My personal acquaintance with the plant leads me to believe that its favorite habitat is within 15 degrees of the equator on the lower lands, in a soil of sandy loam, which is well irrigated for a part of the year, and that it is hardly probable that it would thrive in California, but that it might be expected to flourish south of the frost line in Florida.

THOMAS ADAMSON,
Consul-General.

UNITED STATES CONSULATE-GENERAL,
Panama, March 21, 1887.

REPORT OF CONSUL CONROY.

Annatto is a species of "red dye," yielded by the pulp enveloping the seeds of the *Bixa orellana*, a shrub which is disseminated through the whole island of Porto Rico. This shrub or small tree may be said to be here of spontaneous growth, for there is no instance of any regular plantation being established, nor of any careful cultivation being given to the plant.

The country working people are fond of having planted near their little homesteads two or three shrubs for the sake of the fruit, which they use as a condiment in coloring and seasoning their messes of rice and other food, in place of saffron or red peppers. The annatto plant in its natural or wild state is a scraggy, straggling bush, which often attains a height of 8 or 10 feet, but no doubt by proper cultivation and judicious trimming and pruning its condition and growth would be much improved, and its producing capacity would be greatly increased.

The annatto plant does not require a rich soil; it rather affects a loose soil, in which there are mixtures of clay, sand, and fine gravel, but at the same time it thrives best where it obtains a certain amount of moisture, with heat and shade.

The plant commences bearing at between two and three years' growth. The fruit is produced in clusters of small pods, covered with prickly hairs somewhat resembling the burrs of horse-chestnut, and are very numerous, so much so that a single bush or shrub will produce 100 pounds weight of fruit. The tree will continue to bear for many years without any care being bestowed upon it.

In case of any attempt being made to form a regular plantation of the annatto it would probably be expedient to sow the seeds in properly prepared beds, and transplant the seedlings when 4 or 5 inches high, during suitable weather, and plant out about 800 plants to the acre of ground.

The dye is prepared by macerating the seeds with the pods in hot water, straining out seeds and husks, leaving the subside, or pulp, to settle. The fluid being drawn off, the sediment or residuum is placed in shallow vessels and allowed to dry gradually in the action of the solar rays is detrimental, as destroying the fine coloring

Province, either to Spain

used by dyers for imparting a deep, but not durable or "fast," orange color to silk and cotton manufactures. As previously stated, the exportation from this island of the fruit of the annatto is quite insignificant. The current value of the article in the crude state in which it is shipped is about 4 cents per pound.

As this plant is scattered and grows wild all over the entire island without any care being given to its culture, no true estimate can be given as to the cost of its production. It is gathered mostly by women and children, and disposed of in small quantities at the shops in exchange for provisions and groceries.

EDW. CONROY,
Consul.

UNITED STATES CONSULATE,
St. Juan, Porto Rico, February 28, 1887.

CHINESE AND PORTUGUESE CUTLERY.*

REPORT OF CONSUL FOLSOM.

There has recently been exhibited in the Cutlers' Hall, in Sheffield an interesting collection of Chinese tools and cutlery, and also samples of pocket-knives most commonly sold in the retail shops of Portugal, and a brief description of the same may be of value to manufacturers of similar articles in America.

CHINESE TOOLS AND CUTLERY.

The Chinese patterns were sent here by the foreign office in three lots, viz, implements used in agriculture, from Tientsin and Shanghai; joiners' tools and edge-tools from Swatow, and cutlery and razors from Pakhoi. The object in sending these goods here was to enable local manufacturers to examine them and open up to Sheffield a new market, but the interest manifested on their part has not been great, and doubts have freely been expressed as to the prospect of making a profit at the low prices quoted for the article. Some of the patterns have, however, been copied by local firms, and an effort is to be made to compete for the Eastern trade in cutlery and razors. The attempt has been made heretofore by two or three leading firms, but without much success, for the Sheffield workman is opposed to new ideas or innovations of any sort, and objects to the introduction of patterns with which he is not familiar. Consequently he is not particular about keeping the new work up to the mark in quality, and the manufacturer is the sufferer.

These Chinese articles are finished in the roughest manner and without any regard to appearance; the only idea, apparently, being to produce a blade that will cut, and at the same time possess strength. The wooden handles of the tools and implements look as if they had been hacked out with a hatchet and no finish put upon them. But it is a mistake to suppose that articles of English or American manufacture can take their place, which are merely pretty to look at. The Chinese trade demands an article of worth and durability, and at the same time cheap in price. As one of the British representatives remarks, "Fine finish and polish are quite unnecessary, the only *desiderata* being cheapness and durability."

The razor of which

2 inches in length and $1\frac{1}{2}$ inches in width, with a thick, heavy back. The handle is an ordinary twig or branch, in its rough state, in which a shallow groove is cut to receive the blade when closed. A piece of tin forms the ferrule into which the blade is riveted to the handle. The scissors appear to be roughly hammered out, and the bows are so made that they can be grasped by the whole hand. They sell at about 12 cents. A pocket-knife made of brass, with a thin welding of steel on the blade, which is of brass, is a marvel of cheapness, as the price is only 5 cents. A four-pronged hoe made of steel, with an eye welded on, is sold for 25 cents. Another hoe with an iron handle, or socket for a wooden handle, is 11 inches broad by 8 inches long, solid blade, the price of which is about 66 cents. Two picks are shown which resemble American manufactures, except in finish. The smaller sells at 25 cents, and the larger for 70 cents. In both cases the eye is welded on, and the smaller of the two is made of two layers of iron outside a center of steel. Some trowels are exhibited, square at the end and tapering toward the tang, which is drawn out and runs into a rough wooden handle clasped by an iron ferrule. The price of one with a blade 5 inches long by 2 inches broad is 36 cents. A sickle formed from a piece of steel about one-fourth of an inch thick and 3 inches wide costs 23 cents. A few rudely-made hatchets are priced at from 21 to 35 cents each. Chisels are marked from 9 to 13 cents; and a thin, narrow saw-blade sells at 12 cents. Files vary in price with the sizes, the largest being 40 cents each. Several square hammers, which look like a nut, about 2 inches square, are marked at 15 cents apiece.

The British consul at Swatow says in his dispatch which accompanied the tools:

English cold-chisels and files are very much used here already. Among the miscellaneous tools the broad hoe is universally used. It takes the place of the English, and to a great extent, with small proprietors, of the plow. The stone-cutting chisels, or pointed wedges, are used to a very great extent in this neighborhood, where good granite abounds. Their steel tips are mostly made of imported steel, and stone-cutters pass half their nights in repointing and tempering the basketful of tools blunted by the day's work.

He also suggests that a market might be opened for nails and screws in his vicinity.

PORTUGUESE CUTLERY.

An interesting feature in connection with the exhibit of cutlery sold in Portugal, and sent here by the British consul at Oporto, is the fact that out of thirteen samples, but one only is of English workmanship. The rest were all made in Germany. These pocket-knives vary in price from 5 to 30 cents each, and are finished without much regard to nicety of appearance. The hafts are made of bone or horn, which are ornamented with a crescent and a heart, set in white metal. The blades are, in nearly every instance, square or razor-shaped, and the favorite brand or mark is a fish-hook. The best pattern in the lot for a model is a single-blade knife, $3\frac{1}{2}$ inches long when closed, with a $2\frac{1}{2}$ -inch blade, bone handle,

TONQUIN AS A FRENCH COLONY.

REPORT OF MINISTER DENBY.

In 1884 the French colonial possessions in Asia covered 59,964 square kilometers. As a result of the Franco-Chinese war the Republic increased this area, chiefly in Tonquin, to 149,967 square kilometers. The native population owing allegiance to the French flag shows an increase, also, through the addition of Tonquin, of 9,116,642.

This increase in territory and in population has been purchased by France at a cost, as estimated, of nearly 20,000 men, and about 70,000,000 taels in money.

China also contributes to the cost the lives of almost 100,000 men, lost chiefly by disease, and a sum of money scarcely short of 150,000,000 taels.

The natural inquiry arises as to the profit of such acquisitions as compared with the cost. The only results that can be reached are based on conjecture. It is hardly probable that Tonquin, with the poverty and want of civilization of its people, and the unsuitableness of its climate to European constitutions, will ever be to France what Holland's possessions in the south have been to her. A comparison with French Cochin-China affords the best data for an estimate of the future value of Tonquin as a producer or a market. The last return we have from there is the summary for the first six months of 1886.

The import trade, excluding treasure, was worth \$7,362,000; treasure \$6,368,000, of which \$3,640,000 was on Government account. Of these total imports of \$7,362,000 France furnished only \$1,033,000 in articles for the use and consumption of foreigners. China furnishes more than one-half the remainder, and the Straits have a large share. The export trade of the same period was \$10,895,000, of which nine-tenths was rice. Of this \$87,000 went to France.

This showing, though somewhat in excess of the same period for previous years, cannot be considered encouraging.

Tonquin has three times the population of Cochin-China, and is said to be more fertile. The turbulent character of its people, however, and the proximity to the Chinese provinces will necessitate for a long time to come the maintenance of a large military force and the expenditure of sums of money which will probably make the country a drain on rather than an advantage to France. It is claimed that many of the difficulties now met with will disappear on the construction of railroads, and that a great trade with Southern and Western China will follow the Red River to the sea. It is proposed to construct a line of rail from Laokai near Yunnan to Hanoi to obviate the difficulties experienced by junks in the shallow and almost unnavigable headwaters of this stream.

It is, however, incredible that Tonquin can ever be made a profitable investment of the immense sums expended.

UNITED STATES LEGATION,
Peking, February 17, 1887

CHARLES DENBY.

COMMERCIAL IMPORTANCE OF HIOGO, JAPAN.

REPORT OF CONSUL JERNIGAN.

The commercial importance of Hiogo, Japan, is illustrated by the following tables, showing the different lines of steamers connecting it with the other ports of the world and the tonnage exported to various countries during the year ending November 8, 1886.

The number of lines of steamers actually calling regularly at Hiogo and being in communication with the other ports of the world are four:

French.—The Compagnie des Messageries Maritimes. Mail service semi-monthly. Terminus at Marseilles. This line is extended to Havre, in France, and London.

English.—The Peninsular and Oriental Steam Navigation Company. Mail service semi-monthly. Terminus at London.

German.—The Norddeutscher Lloyd. Mail service monthly. Terminus at Bremen.

Japanese.—The Nippon Yusen Kaisha. Mail service weekly. Terminus at Shanghai. The steamers of this company are in connection with the Pacific Mail and Occidental and Oriental at Yokohama.

Besides these four companies there is another, the Kiugsiu line, German, which call regularly at Hiogo with an average of eighteen steamers per year, but do not carry passengers or mails.

The ports of call and rates of passage of the French company are as follows:

Ports of call.	Rates of passage.			
	First class.	Second class.	Third class.	Deck.
Yokohama	\$16 00	\$10 00	\$5 00	\$3 25
Hong-Kong	50 00	40 00	30 00	20 00
Saigon	150 00	120 00	60 00	38 00
Singapore	110 00	90 00	60 00	38 00
Colombo	240 00	192 00	96 00	60 00
Aden	300 00	240 00	120 00	75 00
Suez	390 00	312 00	156 00	98 00
Port Said	400 00	320 00	160 00	100 00
Marseilles	415 00	332 00	166 00	104 00

Besides the above ports the Messageries Maritimes have connections by means of small steamers of 1,000 to 2,000 tons burden, with Tonquin, Manila, Batavia, Madras, Pondicherry, Calcutta, Madagascar, Mauritius, Bourbon, Mahé, Mozambique, and Zanzibar, all connecting with the main line, some at Saigon, some at Singapore, Colombo, and Aden.

The Peninsular and Oriental Steam Navigation Company have the same service as the Messageries Maritimes, and the two boats of the Japan line call at Nagasaki via the Inland Sea.

The rates of passage by this company are as follows:

First	Deck.
-------	-------

The German Norddeutscher Lloyd* have the same itinerary as the Peninsular and Oriental Steam Navigation Company and the same rates of passage money. Their steamers call at Antwerp, and at Bremen, the terminus.

The Japanese Company Nippon Yusen Kaisha having a regular weekly service to Shanghai; calls at Simonoseki and Nagasaki. The rates of passage are as follows:

Ports.	First class.	Second class.	Deck.
Yokohama	\$16 00	\$10 00	\$4 00
Simonoseki	10 00	6 00	2 50
Nagasaki	16 00	10 00	4 00
Shanghai	35 00	22 00	9 00

The rates of freight by the various companies above named are actually as follows:

To—	Per ton of 40 cubic feet.		Per ton of 2,240 pounds.	
Yokohama	\$1 50	to \$2 00		
Nagasaki	1 50	2 00		*\$1 00
Shanghai	3 00	4 00		*1 00
Hong-Kong	2 50	3 00	\$2 00	to 2 50
Saigon	8 00	10 00	2 00	2 50
Singapore	7 00	8 00	5 00	7 50
Colombo	8 00	9 00	5 00	7 00
Calcutta	10 00	12 00	6 00	7 50
Suez	12 00	13 00	6 50	8 50
Marseilles	16 00	18 00	10 00	14 00
			14 00	16 00
Havre	£ 1 17 6	£ 2 0 0	£	£
London	1 10 0	1 17 6		†2
Antwerp	2 0 0	2 10 0		†2
Bremen and Hamburg §	1 15 0	2 0 0		†2
			1 15 to	2

* Dead weight.

† Copper or antimony, 15s. to 17s. 6d.

‡ For rice.

§ Same rate for Amsterdam.

Mail steamers.—The steamers calling regularly at Hiogo are, for the Messageries Maritimes Company: Meuzaleh, net tonnage 1,273 tons; and Tanais, 1,149 tons. Peninsular and Oriental Steam Navigation Company: Teheran, net tonnage, 1,670 tons; Thibet, 1,671 tons. Norddeutscher Lloyd: Stettin, 1,815 tons. The Japanese Company have no special steamers on the Shanghai line. They change according to the necessities of the service.

Approximate tonnage exported from the port of Hiogo to various countries, from November 7, 1885, to November 8, 1886.

Companies.	No. of vessels.	Hong-Kong.	Shanghai.	India and Co-re.	France.	London.

T. R. JERNIGAN,
Consul.

UNITED STATES CONSULATE,
Osaka and Hiogo, Japan, March 3, 1887.

KEROSENE TRADE OF OSAKA AND HIOGO.

REPORT OF CONSUL JERNIGAN.

On June 18, 1886, I forwarded to the Department a statistical table* showing the extent and value of the trade in kerosene oil at this post from 1882 to 1885, inclusive. I am now able to bring the tables down to a later date and to show the extent and value of the trade in this article for the year ending December 31, 1886. During this latter year were imported 1,216,239 cases. This is more than were imported in the table above referred to. The de-

deliveries and stocks, &c., but the following table will serve in that respect for all practical purposes:

Brand.	No. of cases.	Brand.	No. of cases.
Atlantic	886, 163	Chester	48, 839
Weaver	20, 000	Torchlight	35, 000
Stella	35, 000		
Reereess	191, 237	Total	1, 216, 239

It will be seen from the above table that the largest importations and consequently deliveries have been on the Atlantic brand. This brand has ruled in the markets for some time, but whether its supremacy will remain in the future depends, of course, upon the markets, the supply, the respective values, and the caprice of buyers, conditions which render it difficult to speak of a favorite brand except for the time being.

The prices during the year under consideration ranged from \$1.71 to \$2.05 per case, being an average value of about \$1.82. The highest prices were obtained during the latter part of the year 1886, produced by temporary shortness of stocks, and without this favorable condition prices would probably have not exceeded \$1.75 per case. There is no oil imported into Japan that can compete with American oil. In fact I am not aware that oil from any country except America has been imported at this port. Petroleum in Japan is not scarce, but Japanese petroleum has not yet been sufficiently exported to be important.

It can be stated without reserve that the prospects for the trade in kerosene oil are good. Consumption gradually grows in Japan, and with general improvement in business, which is now progressing, a large demand for this now indispensable lighting material may be fairly reckoned upon. The oil trade is not entirely free from hindrances and annoyances, but no trade is entirely exempt and favored with perfect immunity. If any hindrances, &c., they are chiefly due to the Japanese tendency to combine in rings in dealing with foreigners and to prevent direct dealings between the importer and any distributor not in the ring. But this hindrance to free trade, which seems inseparable from all Japanese commercial affairs, is not peculiar to the oil business, and is gradually being counteracted by the publishing of trade and market reports.

If there is no unfavorable legislation on the part of the Japanese Government in imposing higher duties, American oil will continue to maintain its supremacy in this market.

The cost of loading oil here is, for storage, insurance, and interest, about 3 cents per case (of 10 American gallons) per month.

Transcaucasian ports.....	646,015	2,450,715	174,725				3,096,730
Persia.....	440,035	106,230					720,990
Total.....	45,742,760	82,872,330	9,086,670	55	117,115	60,000	137,878,930
On the Black Sea via Batoum.....	23,327,685	3,193,000		4,193,390			30,714,075
Grand total.....	69,070,445	86,065,330	9,086,670	4,193,445	117,115	60,000	168,593,005

By way of comparsion, the following table, disclosing the exports to Astrachan for the first six months in the years 1884 and 1885, is instructive:

Articles.	1884.	1885.
	Gallons.	Gallons.
Via river Volga:		
Petroleum.....	35,327,825	47,749,005
Residue.....	70,146,620	85,940,360
Crude naphtha.....	5,892,740	7,074,380
Lubricating oil.....	2,320,520	2,679,990
Benzine.....	207,525	23,600
Total.....	113,895,230	143,467,335

According to this exhibit the exports via Astrachan the first half of 1886 were more than in 1884, and but little less than the corresponding period of 1885. The exports via Batoum were appreciably less than in 1884, and but little less than the corresponding period of 1885.

ket for its products than in past years, and that notably the Russian Baltic provinces participated to a marked degree in the increased foreign export trade.

The facts and figures adduced in the preceding tabular statements would not perhaps in themselves be of great moment to the American petroleum interests, in so far as their relations to mere quantities is concerned, if the products of the Baku wells were simply confined to local consumption and to a nominal foreign trade; but they assuredly appear to me to assume a decided significance when the ultimate destination is considered, inasmuch as that indisputably indicates the real distribution of the products of that industry.

Much has been said and written about the progress this inferior rival to a participation in the trade with the United States in European and other foreign countries has made, and it must surely be conceded that if figures mean anything at all, these exhibits clearly demonstrate that Russian petroleum has found its way into every country in Europe and Asia where it is worth while competing for its market.

The astonishing low price for the raw naphtha at Baku and the great facilities for cheap transportation have made its ready introduction into the markets heretofore entirely controlled by the United States comparatively easy, and that the Russian Government is disposed to do its utmost to encourage the export trade has just again been evidenced by an order promulgated by a committee of the imperial ministry, of September last, decreeing that "tin plates," imported into Russia with the declared intention of being re-exported in the shape of cans filled with kerosene, are admitted free of duty, provided a bond equal in amount to the duty is deposited.

Whether the hold upon the different countries where its low price has forced a market for Russian petroleum is to be permanent, or whether the objection to its bad packing, inferior quality, and consequent increased liability to danger will materially impede its general use, are matters that can only be conjectured for the present.

ERHARD BISSINGER,
Consul.

UNITED STATES CONSULATE,
Beirut, February 25, 1887.

THE RUSSIAN PETROLEUM COMPETITION IN HOLLAND AND IN JAVA.

REPORT OF CONSUL ECKSTEIN.

HOLLAND.

The long-delayed, and, in petroleum-trade circles, much-spoken-of first tank-steamer cargo of Russian petroleum arrived in this port on or about the 17th of February. It consisted of a quantity equal to about 7,000 barrels, which was quickly—in less than twelve hours, as I have learned—transferred by being pumped from the tank-steamers to the barges at the wharf.

Consumers, it is stated to me, seem to be satisfied with the quality; and the sales and deliveries, which are estimated to have amounted to about 2,000 barrels in about three weeks' time, would, it is held, have been much greater if the difference in the price between it and the American article had been more significant, as without this there would seem to exist no inducement on the part of the mass of consumers in this country to abandon the use of the American product.

Up to the present the agents here make no offers for future delivery. The manner or condition in which sales and deliveries of the Russian oil are being made, are described to me to be as follows:

American barrels are exclusively being used for the purpose. When filled by the agents, prior to sale, and when desired by purchasers, the barrels are previously repainted, the bodies of them blue and the ends white. After having thus effaced the Standard Oil Company's brand, they (the Nobel Brothers' agents here) place their brand upon the barrels. This, however, is not done in all cases, as purchasers who wish it, or who themselves furnish the barrels, are having them filled and delivered without any alteration, repainting, or restamping of them.

Thus it would appear that while Russian petroleum is not likely to be carried and imported into Holland under the American flag, it would seem to be, to a certain extent, at least, the intention that it shall sail, as it were, under our banner, after being landed or while on shore.

I am not prepared to say whether these practices involve any wrong, legally speaking, whilst, considered from the moral standpoint, they appear to me of questionable commercial propriety, to say the least. I would further not hesitate to remark that it would be more "noble" if the Messrs. Nobel Brothers would cause their petroleum to be sold and delivered in barrels of their own or agents' manufacture, here as well as elsewhere.

JAVA.

Up to the present the American product held undisputed, peaceful possession of the colonial petroleum market, but according to most trustworthy information which I have just received, a Russian petroleum war, as it were, has been declared, the colonies are now threatened with a regular oil invasion, and it would seem to behoove American producers and exporters of the article, and who are more especially interested in the trade of that section, to muster their forces and make ready to meet the enemy.

If reports speak correctly, as I believe is the case, an arrangement has been perfected between Messrs. Nobel Brothers and one of the principal Java houses (Maclaine, Watson & Co.), the latter agreeing to introduce into the Dutch East India colonies the oil to be shipped to them by the former, in tin cases, and establish as great a demand and trade for same as possible.

A first shipment, consisting of 60,000 cases, is said to be now under way per steamer, via Suez Canal. The article is said to be from 10 to 15 cents

I am assured, however, that there exists general doubt whether the "packing" of the Russian oil will turn out or prove to be equally as good and satisfactory as that of the American always does.

Experience had, in this respect, at Bombay, resulted, as I understand, greatly to the disadvantage of the Russian product.

It is believed that in consequence hereof there will be more or less difficulty to dispose of extensive quantities of the oil in the beginning, whilst at the same time it is expected that ere long the required improvements in the manufacture of the tin cans and wooden cases will be accomplished in Russia.

If, then, the difference in the price of about 15 cents per case will continue to exist it will soon be made to appear that Russian petroleum will henceforth be a formidable competitor against the American in the market of Java. Such, at least, is the opinion of parties here who are thoroughly competent to judge the matter.

It is further represented to me that the firm of MacLaine, Watson & Co., above mentioned, with its branch houses at Soerabaya (Fraser, Eaton & Co.), and at Samarang (MacNiel & Co.), is one of the most prominent commercial corporations in Java, and has, on account of its far-reaching connections, special and great facilities to introduce this new petroleum, and create a demand for it, if possible.

Another circumstance mentioned to me, and which is considered likely to operate in their favor, consists hereof: In former years, and for a long period of time, only the "Devoes" brand of petroleum could be sold to consumers of the article, but more recently the mark "Stella" was imported and more or less successfully placed upon the market, so that the mass of the public is no longer, as of yore, prejudiced in favor of the use of just one particular mark.

D. ECKSTEIN,
Consul.

UNITED STATES CONSULATE,
Amsterdam, March 24, 1887.

RUSSIAN PETROLEUM IN JAVA.

REPORT OF CONSUL HATFIELD.

For the benefit of our purchasers, refiners, and shippers of petroleum oil, I would say that a cargo of refined Russian petroleum is now on its way to this island. This fact has only become known within the past few days, since when I have gathered that the importers are a firm established at Soerabaya, that the shipment is a trial consignment on part of the shippers, and comes by steamer; this last point is, however, not yet known certainly. It is not generally expected that this oil can compete with our product as yet, but the fact that the attempt is being made to gain the Java market is significant of the intentions of the Russian producers; if attended with success, or hopes of it, for the near future, other outlets in the East will also no doubt be sought.

TOBACCO MONOPOLY IN PORTUGAL.

the least. The fact that the shipment is understood to be a consignment means that its owners, in anticipation of ultimate results, are not unprepared to encounter a possible loss in order to gain a foothold, this being a sacrifice usually attending the introduction of a new article upon an untried market.

The import of refined petroleum oil from the United States into the Dutch East Indies during 1886 foots up the very respectable figures of no less than 2,643,109 cases, of which to Batavia 478,825 cases; Samarang, 493,639; Soerabaya, 1,089,976; Cheribon, 105,685; Fayal and Pe-kalongan, 227,486; other ports not in Java, such as Macassar, Padang, Bandjermassin, &c., 247,498 cases; figures which need no comment in showing the value of this island as a consumer.

OSCAR HATFIELD,
Consul.

UNITED STATES CONSULATE,
Batavia, February 4, 1887.

TOBACCO MONOPOLY IN PORTUGAL.

REPORT OF MINISTER LEWIS.

On the 29th instant there appeared in the Government journal a royal decree declaring all laws then existing affecting the collection of custom duties on and the manufacture of tobacco in this Kingdom as abrogated on and after the 27th of January, 1887. I annex a copy of the decree referred to, translated from the *Diario de Governo* of the 29th instant.

This is the preliminary step towards the re-establishment of the tobacco monopoly which was abolished in 1863, and the reasons given for this radical change are to be found in the preamble to the decree. This is all that is officially promulgated on the subject, but it is understood that the monopoly will be offered to public competition at an upset price of \$5,000,000 yearly for a term of twelve years, upon which sum a very large advance is anticipated. This sum is somewhat larger than the present yearly revenue collected through the agency of the custom-houses, and it is the belief of the Government that a greatly increased revenue can be secured to the treasury, with less cost of collection, by farming the monopoly as now contemplated.

This decree has the force of law until the new Cortes will assemble, about the 1st of April next, when this and other so-called dictatorial measures will be submitted for approval or rejection by that body and upon which the fate of the present ministry will depend.

E. P. C. LEWIS.

conformity with the advice of my council of ministers, to decree the following provisions:

ARTICLE 1. Prepared tobaccos in the custom-house stores at the date of this decree and those which on that day were in transit to the ports of the continent may be cleared at the existing rates of duty until the promulgation of the law which will alter the present regimen.

ARTICLE 2. All tobacco not under the conditions of article 1, and which may be presented for clearance at the custom-house will pay the duty of 3,500 reis kilo, for cigars, and other kinds 4,000 reis kilo.

Solus. The excess of duties fixed by this article over the duties as now existing will remain on deposit to await the decision of the legislative power.

ARTICLE 3. Are declared null from the date of this decree the licenses established by decrees 21st October, 1863, and 22d December, 1864, granted to such manufacturers who may have closed their work more than three months ago, and as a consequence of this fact the cessation of the sale of their products.

ARTICLE 4. Until the definite decision of the legislature the establishment of new manufactories will not be permitted, nor the modification or enlargement of those already existing, or the reopening of those which have suspended production for more than three months.

ARTICLE 5. The Government will give to the Cortes an account of the present decree.

The president of the council of ministers and the ministers and secretaries of state of the different departments will cause this decree to be executed.

Palace, 27th January, 1887.

THE KING.

Countersigned by all the ministry.

LISBON, *January 31, 1887.*

HORSE-BREEDING IN FRANCE.

REPORT OF CONSUL DUF AIS.

I herewith transmit an extract and translation of a book on horse-breeding in France just published by Baron de Vaux, which may perhaps be of some interest to horse-breeders in the United States. The picture it draws of the insufficiency of serviceable horses may be overdrawn. I give it, therefore, for what it is worth.

Not many years ago Colonel Bridgland, then United States consul at Havre, with the special permission of the State Department, imported horses from the United States for the French cavalry service, which, by a serious advance in freights, subsequently became unprofitable. The time may have come again when an equally enterprising man could perhaps advantageously resuscitate this trade.

F. F. DUF AIS,
Consul.

UNITED STATES CONSULATE,
Havre, March 22, 1887.

HORSE-BREEDING IN FRANCE.

[Translated from "Les Haras et les Remontes" (Studs and Remounts) in France, by Baron de Vaux. F. Rothschild, editor, 13 rue des Saints Pères Paris.]

During the last twenty years horse-breeding in Normandy has undergone a characteristic transformation. The breeding of the large, heavy carriage horse has been profitable enough, as well as the breeding of the lighter, more active horse.

THE CLYDESDALE HORSE.

tions, and the success of the exportation of such horses to the United States is turning the heads of the horse-breeder. North America, Germany, Italy, Spain, and Portugal are greedy buyers of the draft horse, whose quality for this special purpose is incontestable; the prices paid have led the coolest heads astray. The race, by aiming only at size, has undergone a change, the blood is being infused in an inferior class of horses and the result is rather to be regretted.

The great error committed hitherto in the raising of horses lies in the fact that an improvement is relied upon only by the action of the stallion; small farmers have the deplorable idea that any mare is good enough for reproduction, and they generally only keep such mares as are not wanted by the trade or the army. Thus it is that in the best breeding districts at the stations where stallions are serving, 60 per cent. of the mares are unfit for proper reproduction. Hence the result that the horse for army purposes is getting more and more difficult to find; in fact the remounting officer meets only with horses which have been rejected by other buyers, although sometimes willing to concede something to the requirements of the service.

The following data will give an idea of the present condition of things, and they may be relied upon:

The officer of the first remounting district, comprising the depot of Paris and four more in Normandy, received an order in 1885 for 6,387 horses for cavalry service, to be furnished by end of July, 1886. Notwithstanding all his efforts he could not find in this the richest part of France more than 3,532 head, simply for the reason that they did not exist.

Certain details in Normandy show that of 549 horses of the line required, only 247 could be found, and then only by making concessions in the requisites; neither could light horses be found, as in an order for 140 only 97 came forth; 10 horses were wanted for the military riding school, but not one fit for this special service could be obtained; 1,102 light draft horses for the army were wanted, and only 660 could be found. These figures speak volumes. The heavy cavalry horse is disappearing; the light cavalry horse does not exist, and the solid, wiry, and tough artillery horse is getting scarcer and scarcer.

These remarks regarding Normandy apply with equal force to the whole of France. The following notes are taken from the last report of the Superior Council of Stud:

The number of mares served by stallions belonging to the Government was 131,351; the number of those served by stallions belonging to other owners, but approved of by the commissioners, 60,306, making a total of 191,658, which, at the rate of 60 per cent., would produce 114,994 fillies. Admitting a death-rate of 50 per cent. for four years there would remain the number of 57,497 horses produced by superior stallions and by mares of above the average quality. This number is quite insufficient to furnish the 30,000 horses required for the army in ordinary times, by commerce, and for private use, let alone the 60,000 which would be wanted by the army alone to change from a peace to a war footing, and 25,000 more yearly in case of a prolonged war.

There are about 36,000 communes in France, each of which could possibly furnish one horse in war times.

This grave state of things is not to be ascribed to a scarcity of horses in France; on the contrary, this country has relatively the largest number of horses of any country in Europe; her soil is one eminently favorable for breeding them; the most recent statistics giving the number of her horses at 3,000,000, but amongst them all, in times of peace, neither the 30,000 wanted for army, commerce, and private use, nor in war times the 60,000 required to uphold the national honor and to guard the frontier, can be found. This is the incontestable fact.

The fault lies in the carelessness and want of foresight of the horse-breeder and the insufficiency of the means and resources employed by him.

THE CLYDESDALE HORSE.

REPORT OF CONSUL UNDERWOOD.

Clyde in the vi-

seldom seen now except in the feet, and in the dapples which are almost universal upon the animals.

There are some dappled grays, but this color is not one chosen by breeders. There are also many dappled bays; but the most beautiful, in my judgment, are the dark dappled browns. They often have a white star in the forehead, and sometimes one or more white feet. In size they are generally large, sixteen hands and over, and often weigh nearly 2,000 pounds.

The head of the typical Clydesdale horse is characteristic. The jaw is broad, ending in a not very fine muzzle, with large open nostrils. The eyes are large, sagacious, and mild. The forehead is broad and full between the eyes, but tapers upward toward the ears, which are long and active.

The efficiency of the Clydesdale horse is due largely to his quick movements, and it is the formation of his oblique and massive shoulder which gives the long quick step for which he is so much valued. His endurance, especially upon paved streets and hard roads, is due to the extraordinary solidity of his legs and feet. The forearm is broad, seen from the side; the knee is broad and flat; the sinews below strongly marked; the pasterns sloping, and the foot very large.

Doubtless the fringe of hair from the knee to the fetlock joint has little to do with the strength of the leg, but this marked feature is never absent from the best Clydesdale horse. It is by the fineness and abundance of this long silky fringe and of the fetlock tuft that good judges estimate the purity of blood and the enduring qualities of the animal.

The back and ribs of this horse are not always in keeping with his other good points; and in selecting, care is to be taken to choose one whose back is not too long or hollow, and whose ribs are well rounded and well set. The hind quarters are low set, the thighs muscular, the hocks broad and solid, the sinews firm, and the pasterns sloping. The long fringe of silky hair stands out from the leg.

The intelligence of these animals is well known. They are guided either in the plow or cart, without reins, and when called on to exert themselves, do it with a will, as if they were actuated by conscience.

In the streets of this city great numbers are employed, and their size, movement, docility, and fine condition attract the attention of strangers. Those owned by the Caledonian Railway Company, and used in transporting goods to and from the station, are by far the finest working horses I have ever seen.

Large numbers of Clydesdales are sent to the United States for breeding purposes, as the official returns of this consulate show.

FRANCIS H. UNDERWOOD,
Consul.

UNITED STATES CONSULATE,
Glasgow, August 11, 1886.

EXPORTING HORSE STOCK FROM NORTHERN MEXICO.

REPORT OF CONSUL WOESSNER

According to

fore the stock can be loaded for shipment; the result is that buyers are forced to offer stock-raisers a very small price for their animals, or else return home without making any purchases.

At present the exporter from this city must pay on each head of horse stock, males, $68\frac{3}{4}$ cents; females, $\$1.37\frac{1}{2}$, which includes the State tax, payable at the office of the *jefatura de hacienda*, and the city tax to the city treasurer, separately. The charges are as follows:

	Cents.
On each male:	
State tax	31 $\frac{1}{2}$
City tax	37 $\frac{1}{2}$
On each female:	
State tax	62 $\frac{1}{2}$
City tax	75

The stock from this section in size is small, the mules especially so, but are very tough, and when put to work generally give good results.

The shipping rates, per the Mexican National Railway, from here to Laredo, Tex., are as follows (United States currency): For one car-load, $\$43.85$; for five car-loads, each $\$42$; for ten car-loads, each $\$37$. Shipments of five and more car-loads the railroad carries through to Nuevo Laredo, Mexico, where it is necessary to employ a custom-house broker to take out the export permit, which costs $\$1.50$ for the lot properly stamped. Only properly licensed exporters and importers can transact business at the custom-house there. Charges in Laredo, Tex., are (import duties, 20 per cent.), for example:

10 horses, at $\$10$ Mexican money = $\$100$ Mexican, at 79 cents = $\$79$ United	$\$15$	80
States currency, at 20 per cent		20
Import permit for the lot		2 00
Broker's fee for making custom-house entry, say		
State inspection on 50 head or less, per head, payable to the county inspector,		05
50 head or more, each		

The estimated duties must be paid or secured by cash deposit before a permit can be issued for the importation of the stock into the United States, and the importer must present to the collector of customs a consular invoice properly certified to by a United States consular officer at or nearest the place where the animals are purchased. When the value of the stock is less than $\$50$, a consular invoice is not necessary.

Animals specially imported for breeding purposes, and not for sale, may be imported free of duty; the requisite oath in such cases must be made before the consular officer at or nearest the place in Mexico where the stock is purchased, and be duly certified to by such officer; this document has its own form, and takes the place of the regular consular invoice. The collector of customs in Laredo, Tex., also must be satisfied that the animals are intended for breeding purposes, and not for sale; he, therefore, calls for such evidence from the importer as will satisfy him, and if such evidence is not produced, it is his duty to prohibit the importation unless the duties are paid.

Some importers have declined to pay State inspection fees, upon the ground that the State has no right to impose any additional tax on im-

only be made by the person who imports them for that purpose. Animals cannot be imported free of duty which are intended to be sold for breeding purposes.

If an importer undervalues his stock so that, on inspection by the custom-house officer, the value is advanced 10 per cent., an additional duty of 20 per cent. is imposed as a penalty.

JOHN WOESSNER,
Consul.

UNITED STATES CONSULATE,
Saltillo, Mexico, March 15, 1887.

THE DEPRESSION OF TRADE AND AGRICULTURE IN MEXICO.*

[Translated from the Mexican Economist of November 12, 1886.]

In the number of the Economist of November 5 we occupied ourselves in analyzing superficially the report presented to the secretary of fomento by the Messrs. Crespo and Barroso. We now have before us that signed by the chief of department of agriculture, Don Luis Salazar, and we observe with pleasure that this work is not inferior to the other. In the first place, he has taken care to study the general causes which have produced the mercantile crisis, and the depreciation of silver in Mexico, as well as in the rest of the world, and to suggest measures which may favor the development of production, especially the mineral production, in our country. The second report is confined to the study of the conditions of certain articles produced by agriculture, and to indicate what means must be taken to extend their cultivation and to increase the amount of exportations.

Agriculture, excelling in its multiple productions other sources of public wealth, is scarcely developed in our rich and vast territory. To protect and encourage this branch with liberal franchises would be an inducement and stimulus for the investment of foreign capital in the exploitation of extensive districts to-day unproductive.

The author directs his attention to the protection which ought to be given to those products whose export to foreign countries is already manifest, notwithstanding the multiple obstacles they have encountered in the beginning of their establishment, and divides those products into groups and in the order in which, in his conception, they should receive a protection sufficient for their development, as follows: (1) Breeding of animals, and skins; (2) textiles, henequen, ramie, pita of Oaxaca, ixtle, lechugilla, maguey, organo, jute, flax, cotton, and silk; (3) tobacco and coffee; (4) fruits, wines, and vanilla; (5) woods and zacaton.

Mr. Salazar attributes great importance, and not without reason, to the industry of raising animals and to the traffic in skins, and in order to demonstrate his idea presents abundant data, among them the prosperity which Texas has reached, on whose territory it is calculated there exist 5,000,000 head of cattle, representing a capital of \$100,000,000. He believes, at the same time, that if the States of Sonora, Durango, Chihuahua, Nuevo Leon, Coahuila, Tamaulipas, and Vera Cruz, with the rich lands they possess, and in spite of the scarcity of water, should encourage the breeding of herds, methodizing the immoderate exportation which has been made, a success will be obtained in this branch similar to that which Texas enjoys. To obtain that end the author of the report states:

"An industry which contains conditions so favorable for their undertaking can, with little effort, be urged forward by the Government. In fact, it all consists in dividing up in a suitable manner the immense extensions, measured or being measured, forming ample farms, suitable for the breeding of animals, provided naturally or artificially with water by means of artesian wells or tanks, and watched by bodies of troops that are constantly in movement, as a cautionary means of security.

"Said farms under similar conditions can be offered to intelligent colonists, on an equitable basis and for easy acquisition.

"If it were possible to select people for the

MEXICAN TRADE AND INDUSTRY.

"In the business of breeding animals, the larger the scale that it is carried on the more productive it is; but this requires the possession of extensive possessions, difficult to be attended to by the vigilance, capital, and work of one individual alone.

"From this arises the utility of establishing great societies or companies, whose interests insure economy in the management of the greatest number of animals with a greater profit as a consequence.

"It is now time to put in practice the means of protection, which economically may be thought convenient, to favor the breeding of cattle in Mexico, since the fabulous increase that the production of this branch reaches day after day in the United States will exhaust in a short time the lands sufficient for the maintenance of the flocks, and the surplus will overflow into our frontier States, which possess abundant and cheap pasturage. Let protection be given, and foreign agricultural capital will not delay to cross the river Bravo to establish itself on our territory. The inconsiderate exportation which has diminished our herds can with facility be converted into a current of importation.

"As respects the traffic in hides and skins, I have here the means of facilitating its development.

"As is logical, the impulse which the branch of furriery, may receive will depend, in the first place, on the increase which the breeding of cattle may have in Mexico. Besides the immunities from taxation, the cheapness in the freights of railroads and steamers, and the propagation of the knowledge which will serve to perfect and quicken the methods of tanning, granting premiums to those who distinguish themselves most in this branch, will be so many other stimulants to assist the greater production and exportation."

The part which Mr. Salazar devotes in his study to the textile plants, appears to us interesting. According to the data which he presents, there exists in Yucatan 823 farms producing hennequen, which have under cultivation 1,002,905 mecatres, or 577,773,280 square varas. Ramie is a plant whose cultivation has been tried also in the Republic, and according to appearances the lands which offer better conditions for its culture are found in Puebla, Vera Cruz, Aguas Caliente, San Luis Potosi, and Michoacan. Properly attended to the industry of this plant could acquire greater importance than that of the hennequen, its market value being greater and its cost of production comparatively less. As regards the ixtle, it is now employed in the manufacture of ropes, &c., but its true future will be found in its application to the manufacture of paper. It is produced in abundance in Tamaulipas, Nuevo Leon, Vera Cruz, Oaxaca, Chiapas, and Michoacan. The lechugilla is another plant which could be used advantageously in the same manner as the ixtle in the paper industry, it being now employed only and on a small scale for bagging, pack cloths, &c. The principal zones in which it is cultivated are Tamaulipas, Chihuahua, Coahuila, Hidalgo, and Nuevo Leon. The magney has not been used as a textile material; it is believed, however, that it is susceptible of being utilized for this purpose, care being taken to cure its leaves at the appropriate period of its growth. Another important material, of which at present no use is made, is the organo, a plant which can be employed also in the manufacture of paper. Very few satisfactory results in Chihuahua, Tlaxcala, Chiapas, and Mexico. Concerning the cotton industry, we find in this report interesting data, which demonstrate the susceptibility of our country to produce sufficient for local consumption without the necessity of importing it from abroad. This plant can be cultivated and is cultivated in Vera Cruz, Tamaulipas, Sonora, Sinaloa, Tepic, Jalisco, Michoacan, Guerrero, Oaxaca, Chiapas, Chihuahua, Coahuila, Durango, and Nuevo Leon.

The following statement shows the importance of the cotton production and industry in Mexico:

Cotton gathered.....	kilos..	31,774,400
Manufactories of spun cotton and of cotton textures, about.....	hectares..	50 to 60,000
Probable extension of ground employed.....	number..	237,890
Value.....	do....	9,000
Spindles.....	do....	11,000
	pieces..	318,184
		330,540

fices, protected by exemptions from interior and exportation taxes during a fixed period; in the gift of spinning-wheels and special apparatuses, and in the concession of premiums to those who distinguish themselves in the production and exportation by the quality and quantity of the silk elaborated.

The climate, the economical workmanship, the abundance of lands appropriated to the planting of mulberry trees, and a near market, are conditions which unite for the favorable cultivation of silk in Mexico, with little sacrifice to the nation.

Referring to the tobacco, Mr. Salazar says: "The production of tobacco in Mexico can be considered localized in the zones of both coasts, but unquestionably the cultivation offers a greater change of development in the States of Tamaulipas, Vera Cruz, Tabasco, and Oaxaca, which count upon lands, and elements already tried, and from which practically they ought to expect an opulence extending its cultivation; to increase the exportation, to-day comparatively limited."

In the region before mentioned are encountered very fertile lands, whose composition has been proved by analysis to be of superior quality to that of the lands in Havana, as in the celebrated Vuelta Abajo; here also the lands and the climate permit the cultivation of tobacco, under the conditions most favorable to give it the exquisite flavor which makes it so much appreciated throughout the world.

These circumstances, and that of the production of Havana tobacco, being every year less, as is believed, owing to the impoverishment of the lands, enable us to be the providers of Paris, London, Berlin, Russia, New York, and even of South America, where the demand increases in proportion as the Havana tobacco diminishes in quantity and quality. One single country, the United States, imports more than 70,000 quintals of leaf-tobacco from Cuba annually.

Mexico finding itself in climateric conditions so advantageous for the cultivation of good tobacco, it is now time to uniform its classes, perfecting and making them known, under their true names, in Europe and the United States.

The coffee plant is produced in Chiapas, Colima, Durango, Guerrero, Jalisco, Mexico, Michoacan, Morelos, Oaxaca, Tabasco, Tamaulipas, and Vera Cruz. To encourage its cultivation and exportation, the author of the report dwells on the following points:

The measures which are to be advised to urge on the production of coffee consist in premiums, according to the quantity and quality of said production. For the exportation it is advisable to free from custom-house duties coffee, permitting at the same time the free introduction of bags, whose re-exportation is guaranteed.

The concession of unappropriated lands under conditions of economical acquisition, and at long terms, would be a greater stimulus for those who promise to plant great quantities of coffee trees, supplying both capital and laborers for the work. Another important branch of agriculture, which can be cultivated with great profit, is the traffic in fruits. Up to the present it has been limited to reduced exportations by the Central Railroad and the maritime route, notwithstanding it is susceptible of an infinitely greater development, having a market near at hand, which would consume all the quantities remitted. In regard to this matter the author says:

"The direct encouragement of this great wealth of the country would cost very little, since the immense quantities of fruits which are produced, of an exquisite taste and unsurpassable quality, do not need great expenses in their cultivation and collection. The facility and cheapness of the ways of communication, and the free transit and exportation of them, are a sufficient protection. Indirectly, it would be advisable to stimulate this branch of production with some fiscal concessions which would especially tend to establish a perfected system of cases for the easy, economical, and convenient transportation of the fruits, and avoid the delays and obstacles to which these are subject in their passage, by official documents and certificates, and which in many cases are a mere form.

"The conservation of fruits in tin cans is another industry capable of producing by itself alone notable incomes in our mercantile movement, and the best assistance which can be lent to favor their consumption abroad is the exemption of duties of transit and exportation, and of those which actually oppress the tin plate so necessary for the cans, their re-exportation being always guaranteed.

"On this account it will be proper to favor it also by the free introduction of sacks, barrels, bags, boxes, and in general of all the objects and materials which serve to preserve and transport the national fruits, if this does not injure other similar industries established in the country, and which effectually satisfy the necessities of exportation.

"The experiments made for the exportation of fresh fruits have failed, on account of the defective packing employed. In July 1884

business the development of which it is susceptible, and which can give numerous benefits, without the inconveniences pointed out."

To resume, the commerce in fresh fruits, preserved and in sugar, offers a favorable prospect in the market of the United States, whose inhabitants consume every day greater quantities, and of which, under very advantageous conditions, can be their principal providers, by the railroads of Paso del Norte, Laredo, Nogales, and Piedras Negras, as well as by our Gulf ports and by the gulfs of the Northern Pacific of our territory.

In the same category as the fruits, Mr. Salazar considers the wines an industry which has come to acquire a certain importance, thanks to the efforts of the secretaryship of Fomento, which has liberally distributed vine shoots imported from Europe. According to the figures registered in this report, the quantity distributed has been 1,383,954 vine shoots.

Mr. Salazar says:

"It is perfectly proved that we possess appropriate lands in very considerable quantities, that, as well for their altitude above the level of the sea, or rather for their latitude, possess favorable conditions for the acclimation of the vine.

"The official reports rendered to the secretary of Fomento by the inspectors of cultivation confirm the exit reached in the cultivation of the vine in Chihuahua, Zacatecas, Aguas Calientes, and Puebla.

"But more particularly the lands of Paso del Norte in Chihuahua, and of Aguas Calientes have called the attention of the learned inspector, Hermenegildo Barango. "In fact there are in Paso del Norte above 200,000 vine stocks, whose last crop produced 100,000 arrobas of grapes, of which only 3,000 were sold as fruit, the rest being made into white and red wines, which were consumed in the same state of Chihuahua. In Aguas Calientes the number of plants in production is calculated as 260,000."

I have before me the measures which Mr. Salazar recommends for the encouragement of this new industry.

For the present we ought not to form the illusion that we can in a short period be exporters of wines, notwithstanding that the climate and soil of an extensive part of the republic are propitious for an incalculable development of the production of the grape in quantity and quality. But the riches which result from the development of vine culture are not on that account inconsiderable, if we consider that they will enable us to reduce our foreign importations.

Besides the cultivation in a certain scale requires the conjunction of much labor of both sexes, and from this results this industry converted into a lever of colonial power. It also gives an opportunity to other new industries, such as the fabrication of barrels, casks, bottles, corks, &c., which will add their contingent to enriching the country.

The protection which could be imparted to this branch consists, in the first place, in the immigration of colonists proved as experienced in the cultivation, whom it would suit to settle on the farms of those who already have vineyards, making special contracts with the proprietors who will guarantee, with the protection of the Government, their interests and those of the colonists.

The establishment of vineyard stations in the principal places of production of the vine will be very useful to teach pruning and culture, and the fabrication of different kinds of wine susceptible of being produced, co-operating with this to the development of the industry.

Perhaps as a medium of protection, it would be advantageous to add additional taxes to foreign wines that in Mexico are only consumed amongst the wealthy classes. Also there could be granted, as a privilege, the free importation of machines and apparatus necessary for this industry, and also for the present an equally free importation of barrels, casks, and corks.

In the group of fruits and wines, Mr. Salazar places the vanilla, whose exportation can increase with some greater activity amongst those who cultivate it.

The exportation of fine and dye woods has been, and is even now, sufficiently active, but without doubt could be augmented if there did not exist two causes which obstruct its development.

(1) The fiscal charges that repress it, united to the heavy expenses of exportation. (2) The excessive felling of small trees, whose exportation injures the market of large trees, which make almost ruinous this traffic, and for getting, from the

It would be advantageous not only to levy a duty of one or two dollars for each tree cut on national grounds, but also to stipulate that the cutters plant at least three trees for each one they have cut, and, finally, it would be advantageous to levy additional duties on the woods imported from abroad.

Respecting the zacaton, Mr. Salazar says:

"The zacaton is a wild plant, that is produced in abundance in Huamantla, San Andres, Chalchi comulo, Perote, San Felipe del Obraje, and many other places of the cold climate.

"The actual price in the places of extraction is from \$1.75 to \$1.88, and the crop can be calculated at 90,000 arrobas annually.

"The development of this plant is imperfectly carried on, and the protection which could be imparted to this growing industry would be to grant certain immunities and premiums to those who introduce machinery adapted for the gathering, cleaning, and cutting of the zacaton. In this manner without doubt we would be able to cheapen the expenses of said industry, and augment the exportation by the facility of consumption."

The learned author of the report concludes thus the ideas which he has manifested in the special paragraphs, which he dedicates to every article of traffic:

"The facility of production of our soil being recognized, and the reasons being explained which make us presume very possible our prosperity, in a period of time not very far off, by only stipulating a decided protection, which will tend to increase the production and exportation of national fruits; to condense the ideas, it is only necessary to recapitulate what are the possible measures of stimulus and protection that it would be convenient to dictate, relationed to so important branches of public wealth as are agriculture and commerce.

"It is not sufficient that nature has endowed our country prodigally with the abundant elements, which it possesses, to produce a multitude of agricultural articles, and especially those before enumerated, in sufficient quantity to supply the principal mercantile centers of Europe and our commerce with the United States. It is necessary that the agriculture and commerce of its products be protected with especial immunities, which will give inducements and security to the capitals which are dedicated to this industry.

"It is proper in the first place to recommend the observance of the decree issued in May, 1868, which expressly orders as follows: 'No State can recover duties for the simple transit of merchandise.'

"The difficulties are infinite which producers and merchants encounter in their transactions, owing to the system of interior custom-houses and excises. Undoubtedly the interior circulation, free and without hinderances, would contribute to the prosperity of commerce.

"One of the great elements for the development of public riches, and very especially for the agriculture and the commerce, is the establishment of ways of communication between the zones of production and the markets of consumption. The geography of our country is extremely accidental, and the private domain embraces extensions so extensive, that there results an almost insuperable difficulty for the transportation of effects to the principal centers of consumption and to the ports destined for their exportation.

"The Mexican Central and Vera Cruz Railway lines have already served very much to develop the general traffic; the lines not even terminated of the National Constructor, and of the Interoceanic, of Acapulco, Mexico, and Vera Cruz, also lend a useful contingent to the local movement of limited regions. But our vast territory demands in a pre-eminent manner to terminate these lines and open other general arteries of circulation, and particularly to multiply these local ways of communication, whether wagon-roads or railroads, whose preservation should be under the charge of the town corporations, or, better even, establish economical railroads of 60-meter width (system of Decauville or any other whatever), for the transportation by cheap freight of the products of each region, and constructed with funds proportioned by the federation, the states, and private persons, within the true meaning of the railroad concessions, it would be useful to reduce the actual tariffs of the working lines, which will really favor the commercial traffic of importation.

"In the railroads, whose concessions for whatever motive have to be modified, and especially in the new concessions which are granted in the future, it is proper to foresee the immunities which ought to be granted the fruits for exportation, although for it the subventions would have to be more liberal.

"As far as possible, and without injury to the

"For a period as extended as possible, and after suitable study, it would be well to see if the excessive charges on the importation of certain effects and apparatus, which serve for the improvement of agriculture, can be removed.

"The employment of coverings, boxes, bags, &c., suited for the preservation and economical transportation of national products being particularly necessary to conserve the credit of our exportation, perhaps it would be useful to employ the concession ordered in the tariff, permitting the free introduction of boxes, barrels, sacks, bags, and tin plate necessary for the object indicated, the re-exportation being always guaranteed in a sufficient time, if it does not injure new industries that may be established expressly for the construction of good coverings, boxes, bags, cans, &c.

"It would be advantageous to induce the governments of these several states, studying their peculiar interests, not to impose inconsiderate taxes on the new agricultural interests which may be established, neither on those already established, to the end that they should receive the increase of which they are susceptible.

"The foreign capitals which dedicate themselves to the development of agriculture ought to be attracted by concessions of national lands, bestowed in every case at moderate prices, and to be paid for on long terms, facilitating thus their acquisition.

"Equally, some national lands, suitably divided into different plantations and economical constructions, can be distributed, all made by contract, to receive foreign agricultural colonies, whose numbers prove they have knowledge and elements of work. That distribution of lands, once producing, will facilitate notably the establishment of colonists, and that these can in a relatively short period of time indemnify the Government for the value which they have received.

"Premiums can be created for those who, in virtue of previous regulations with the Secretary of the Interior, supply with water the regions devoid of it, whether by means of artesian wells or tanks, and whose premiums will be in proportion to the volume produced, the scarcity of water in the locality, and the superficial extension benefited. In the premiums granted to those who construct tanks the relative amount of the capital invested will besides be taken into account.

"It would be proper to grant premiums to agriculturists who, in a certain scale, produce articles appropriate to be exported. These premiums can consist of those ordered in the law of colonization to colonists and companies, or in the donation of machines perfected for cultivation. Also, with the premiums, the exportation ought to be stimulated in a certain scale, granting in a determined grade pecuniary or honorary recompenses to those who distinguish themselves with this motive. Said premiums could be for a fixed quantity, or for interest on the capital invested, payable in both cases with paper denominated 'warrants in favor of the exportation.'

"The Government would regulate the form and proportion in which said paper would be received, whether in the payment of certain taxes, or of duties of importation, which foreign effects originate introduced into our ports.

"The establishment of warehouses of deposit for foreign merchandises, conformably to what is ordained in the tariff of maritime custom-houses, would be one of the most important advantages that the commerce could obtain for its development. Equally it would be proper to establish them for merchandises exported.

"Exportation will be much favored by exempting from the duty of tonnage not only steamers and sailing ships which arrive with ballast in our ports to load national effects, but also said sailing ships which come with cargo and return exporting our products. This concession is of vital importance to our exportation, if it is taken into account that on one part the enormous port duties, and on the other the insecurity of our anchorages and bays, increase enormously the freights of the products of the country exported. At the greater part of our ports of exportation steamers do not arrive with freight, for the reasons before expressed, and because the delay in the act of loading and unloading causes prolonged and expensive sojourns. It is advantageous, then, to grant the concession which is indicated, to the sailing ships, making it known in the most ample manner in Europe and the United States.

"The establishment of permanent museums of our national products in the Mexican can consulates abroad would be the most efficacious and economical manner of making known the vital forces of production of our country.

"By this means we would be enabled at the same time to combat the very frequent frauds of presenting the Mexican products as proceeding from other countries."

"The farmers do not like to ask for money lent, since according to their mode of thinking the application for credit is a sign of difficulties and entangled business.

"If they see themselves obliged to contract a debt, even though it may be for an advantageous operation, they conceal it as much as they can, although they have to pay the secret at the price of a more elevated interest, as though if it were known they would lose the estimation of the rest. This prejudice created in the mind of the farmers is easily eradicated, with only time and the exact knowledge of the risk incurred, with the concurrence of foreign capital. Also, the merchants and the artisans had in another time the honor of not working but with their own capitals.

"The personal condition of the farmers, taken as a mass, is inferior in instruction to that of the merchants and artisans; they are less apt to comprehend and manage the paper, as of trustworthy value, which is the indispensable instrument of credit. But ways remain open to the farmer to guide himself commercially, if the efforts of the Federal Government and of the States tend to develop the primary instruction for the diffusion amongst the rural populations of the economical elements and of the natural sciences, without which agriculture is condemned to be no more than a routine in our country.

"Bringing to a close what has been said, it appears useful to study the general thought contained in the anterior lines under two phases. The first is to introduce amongst the country people the use of loans, with the object of improving cultivation and augmenting production. The second is to establish the basis of agricultural credit, making movable the capital of the farmer, without hindrances which cause him embarrassment in his transactions.

"The creation of a great financial establishment, instituted guaranteeing to offer sums of money exclusively to agriculture, under very moderate terms, will be the accomplishment of the development of this element of public riches.

"With these measures and those which are dictated in harmony with those for the protection of mining and colonization, we will have succeeded in guiding the capacity of traffic of the Republic to a distinguished position amongst commercial nations."

Judging of the reports we have examined, that of Messrs. Crespo and Barroso, and of Mr. Salazar, the whole pamphlet published by indication of the honorable secretary of fomento is destined to lend great and positive services to all the industries of the country, showing them the most practical means of developing all the sources of national riches, so that the effects of a mercantile crisis as that which we now suffer from will be less felt in the future.

M. ZAPATA VERA.

TRADE OF MEXICO WITH THE UNITED STATES.

REPORT OF VICE-CONSUL WINSLOW.

I forward the inclosed list of the exportations of the principal American products from the United States to Mexico for the month of August, 1885 and 1886, and the sum of the exportations for the months of July and August for the same years.

It will be seen that the exportation of raw cotton to Mexico for the month of August, 1886, was reduced to \$713 from \$69,361 for the corresponding month of 1885. This is probably owing to more cotton being raised in Mexico than formerly, and that at this rate, instead of importing cotton, Mexico will in a few years export it.

Of cotton cloths the United States exported to Mexico, in the month of August, 1885, to the amount of \$52,581, and in 1886 but \$39,517. This may be owing to the fact that new factories for cotton cloths have been established here and Mexicans are depending more on their own manufacturers.

Of corn there was exported to Mexico from the month of August 1885

MEXICAN TRADE WITH THE UNITED STATES.

\$3,160. This falling off can be accounted for by increased acreage of land in Mexico devoted to the cultivation of tobacco and the increased use and quality of Mexican tobacco.

In the month of August, 1885, the United States exported to Mexico steam engines to the value of \$32,886, and for the corresponding month of 1886 to the value of \$22,138.

In sewing-machines there was a falling off in the value of exportations from the United States to Mexico for the month of August, 1886, compared to that of August, 1885; also of agricultural implements, refined sugar, sheep, lard, butter, cotton manufactures, and tallow.

There was an increase in value of exportations from the United States to Mexico for month of August, 1886, as compared with the month of August, 1885, of the following articles, viz: Charcoal, flour, printed publications, lumber, petroleum, and railroad cars.

From July 1 to August 30, 1885, there was exported from the United States to Mexico of the principal American products the value of \$726,843, and for the corresponding months of 1886 but \$535,762.

These figures go to show that the importation of many articles by Mexico from the United States is decreasing.

CHARLES WINSLOW,
Vice-Consul.

UNITED STATES CONSULATE,
Guerrero, Mexico, March 19, 1887.

Exportations from the United States to Mexico for the month of August, 1885 and 1886.
[Principal American products.]

Merchandise.	1886.		Values, 1885.
	Quantities.	Values.	
Raw cotton	6,624 pounds..	\$713	\$69,361
Agricultural implements	56,784 pounds..	797	3,108
Refined sugar	2,456 tons..	5,534	6,775
Charcoal	6,905	6,552	2,846

DAIRY EXPERIMENTS IN DENMARK.

REPORT OF CONSUL RYDER.

I present a report on the experiments which have been carried on under the auspices of the Danish Government in relation to the ice-cooling of butter during its stage of repose in the dairy, as well as under its transport by rail and steamer.

At the experimental laboratory experiments have been made in the two last summers on the effect upon butter cooled by ice between the time of its manufacture and of its sale in the English markets.

Some have held that preserving butter in somewhat highly ice-cooled chambers tends to injure and not improve it, whenever at any later stage it might be exposed for a few days to ordinary summer heat.

In the experiments to test this matter the several butter samples have been judged in this country by three Danish butter experts of high repute, whilst in London and in Newcastle the samples were adjudged by members of three butter-trading firms of high standing. The butter used in the experiments, consisting altogether of 94 half-firkin casks, was the produce of the most noted dairies in the Kingdom, in every case prepared and treated at each dairy by the dairy-women of the place precisely as was the general usage of the dairy. At least two samples of identical make were taken, of which the one was retained and transported in an uncooled chamber, as had hitherto been customary, whilst the other was preserved and transported in ice-cooled chambers.

Three days before the judgment should take place the butter samples which had been preserved in the ice-cooled compartment were removed to the cellar chamber, where they were placed side by side with the other class of butter samples there deposited, so that the whole of the butter on the day of adjudication should have the same temperature.

As regards the experiments made in 1886, it may be mentioned that for these ice-cooled boxes were provided, into which the iced samples were deposited the moment they were made ready, and they remained in these boxes during their stay in the dairies as well as being transported by rail and steamer to the places where the judgment should be pronounced, Copenhagen, Newcastle, or London.

The butter with destination to England was forwarded on a Thursday afternoon, arriving in Newcastle on the Sunday following, and was discharged on Monday either into the warehouse cellars at that place or were forwarded by rail to London, where they would arrive on the following morning, and were placed as speedily as possible in the warehouse cellars. In London as well as in Newcastle the ice-cooled samples were laid side by side with the cellar samples two days before the adjudication took place.

shortly after their removal from the iced compartments, would nevertheless be found to deteriorate rapidly, more rapidly than the cellar samples, after standing under an ordinary temperature.

There have been held in all four series of experiments, and the following table shows the results :

Series.	Place.	Iced sample.		
		Number times better.	Number times equal.	Number times worse.
1	Copenhagen	23	0	1
2	Copenhagen	55	5	0
3	London	10	5	3
4	Copenhagen	57	3	0
	Newcastle	41	15	4
	London	28	0	2
	Altogether 252 times	214	28	10
	Expressed in percentage, giving	85	11	4

The following figures denote the average proportional adjudged values in all the experiments for each ice-cooled or cellar sample :

Award.	Ice-cooled.	Cellar sample.
First	100	97.4
Second	100	94

The results of these experiments may thus be summarized :

- (1) That the ice-cooled samples, after standing over from two to three days in the butter-cellars, at a temperature of from 15° to 19° C., have steadily been found better than the cellar samples.
- (2) That the ice-cooled samples, after having further laid over for about a week in the same cellars, have still maintained their ascendancy over the cellar samples.

This result has only been attained by keeping the ice-cooled samples in an iced condition from the time when they were prepared in the dairies and until two to three days prior to the day of award ; and whenever both dairies as well as the trains and steamers are provided with properly-arranged chambers, the cooling will then most surely contribute towards raising and upholding the reputation of Danish summer butter on the English markets.

The experiments would also appear to have repelled the theory that a more frequent communication between Denmark and England would increase the market for butter, inasmuch as in 28 comparisons made between "newest" and "oldest" butter, the difference being seven the "newest" butter has in 25 cases and the "oldest" only in 3 cases. It was also shown that the difference

not possess such favorable conditions of temperature as to occasion no other means of obtaining a greater degree of cooling.

Experts in the butter trade were sent from this country to Sweden and ascertained that once a week a train on the Swedish main lines is dispatched provided with refrigerated wagons for butter. The temperature of these Swedish ice-cooled cars closely approximated to that of the cooled boxes used here in the experiments just described. There can therefore be no difficulty in procuring such a temperature for daily practice.

Supposing that refrigerated compartments are not arranged in the trains and steamers, an extreme course of cooling in the dairies will undoubtedly prove of great benefit, as butter is so bad a heat conductor that a cask of the size of one-third barrel, after having been cooled to about 0°, is found to resist the destructive effects of a high temperature for a much longer period than an uncooled cask.

In this refrigerating system one circumstance may arise which should not be overlooked: Dealers may find a greater difficulty in detecting any defects in the ice-cooled butter. The cooling may, for this reason, place the butter trade upon a less safe basis.

HENRY B. RYDER,
Consul.

UNITED STATES CONSULATE,
Copenhagen, December 18, 1886.

FRENCH DUTIES ON CEREALS.

REPORT OF CONSUL MASON.

After more than a year of agitation and discussion the act increasing the present duty of 3 francs per hundred kilograms on wheat imported into France to 5 francs was yesterday finally adopted by the Senate. The new law will be promulgated and take effect immediately. Its final enactment has been generally anticipated since its passage by the House of Deputies nearly a month ago, and its immediate effect upon the breadstuffs market has been therefore discounted and prepared for.

A similar amendment, to raise from 8 francs to 10 francs per hundred kilograms the import duty on flour, is under consideration, and its adoption is deemed probable, since otherwise the enhanced duty on wheat would stimulate the importation of flour, and thus be prejudicial to the interests of French millers.

The measure which was finally adopted yesterday has been the most important theme of debate during the present session of the Assembly.

The increased duty has been advocated in general by two classes of deputies, viz, those who represent agricultural constituencies and those who have felt that the revenues of the Government were in such condition as to demand this final sacrifice—a tax that would increase the price of bread. It was generally opposed by deputies and senators who represent sea-ports and purely industrial communities. The members of both houses from Marseilles, Bordeaux, Havre, and other factory districts did not

During the same period the House of Deputies has voted to advance the duty on oats from $1\frac{1}{2}$ francs per hundred kilograms to 3 francs; but, on the other hand, it has refused to impose any duty on Indian corn, which remains, as it has been hitherto, on the free list, as a raw material.

The reasons for this apparently contradictory policy with respect to oats and maize are as follows: Oats are grown quite extensively in France, and an increased duty would not only yield a considerable revenue, but would stimulate still further the culture of that cereal. But corn is not cultivated at all, except in three or four departments, and has of late years been imported largely both as food for cattle and for the manufacture of alcohol. It is doubtful whether maize could be so profitably grown on more than a very small part of the area of France, so that to levy a duty on a product thus limited would be to increase the price of corn, and thus discourage the better feeding of hogs and cattle, and at the same time have the effect of putting an increased bounty on the culture of the sugar-beet for alcohol manufacture. But beet culture is already sufficiently protected by the high import duty on raw sugars, which has raised the beet-sugar product of France to 298,407 tons per annum and caused great alarm to the French colonists and the importers and refiners of cane sugar. Accordingly, maize will continue to be admitted free as a raw material for stock-feeding and the distilling of alcohol.

It may be of interest to examine briefly the probable effect of these several changes in the French tariff upon the imports from the United States.

The new law raises the former tariff of 15.8 to 26.3 cents per bushel on all wheat imported into France. This, at the present value of American wheat, would be equivalent to an ad valorem duty of more than 28 per cent. on the raw material of bread, and it is not surprising that the bakers in many French cities and villages have already advanced their prices from 8 cents per kilogram to 9.

Estimated on the basis of last year's imports, the present tariff on wheat would yield a revenue of about \$14,300,000 per annum, an important item in the French budget.

The far more serious question, however, is whether the increased duty on wheat will have the promised effect in encouraging a larger home product and thereby restrict and gradually diminish imports. It is not believed by those best informed on the subject that the enhanced tariff will have any immediately serious effect of this kind. French people of all classes are remarkable eaters of bread. Carefully prepared statistics show that the average annual consumption of bread by each inhabitant of Marseilles is 214 kilograms, or 460 pounds, against only 151 pounds of meat. Whatever else they may lack, the French people, rich and poor, must and will have bread, so that it is not the rate of duty, but the extent of the home wheat product and the consequent deficit, which will in future, as they have in the past, determine the amount of wheat imported. It has been predicted and promised by the French farmers that if the tariff were raised to 26.3 cents per bushel, it would encourage the French farmers to increase their production of wheat to the extent of 100,000,000 bushels in seven years.

cents per bushel) was passed with the same protective purpose, but it has had thus far no appreciable effect on the home wheat acreage or crop. The harvest of 1886 yielded 43,000,000 bushels less than that of 1885, and the opponents of the increased duty have pointed eloquently to the present distress of French industry, and predicted that, without sensibly relieving the farmers, it would lay a grievous and burdensome tax upon the laborers' food. The fact will probably be found about midway between the expectations of extremists on both sides of the question. There will be, no doubt, after this year some increase in the area of wheat planting, which in very favorable seasons may raise the aggregate product to nearly the 340,000,000 bushels which this country annually consumes; but, during unfavorable and even average seasons, there will still be left a large deficit to be filled by importation.

Much of the land which for ten years past has been used for wheat growing belongs by right to the far more profitable business of grape culture. The farmers have sowed grain only because mildew and phylloxera had destroyed their vines. Now that the latter and principal of these pests has been circumvented by artificial submersion, or the planting of American vines, the wheat fields of the past decade are being reconverted into vineyards, and no 5 or even 10 franc duty on wheat will check this return to the most lucrative culture of which French soil is susceptible.

France imported during the year 1886 33,426,500 bushels of wheat, of which 11,068,000 bushels came from the United States. At the port of Marseilles the receipts during the same year were 17,948,000 bushels, of which 1,686,300 bushels were supplied by the United States, 6,555,700 bushels came from Russia, 963,000 bushels from Turkey, 4,324,800 from British India, 719,200 from Roumania, 3,536,700 from Algeria, and the remainder from various other countries. The anticipated adoption of the advanced tariff has not seriously checked importations, and there are at this moment several cargoes afloat from New York and San Francisco for entry at this port under the new duty.

From what has been said above respecting maize, it would seem probable that there may be in future an increased French demand for American corn, which in point of quality ranks first in this as in other markets.

At the present moment, however, a sharp and fatal competition is offered by maize of an inferior quality from the Danube, which, since the spring opening of navigation in that quarter, has been forwarded in large quantities, and is now offered afloat in Marseilles docks at 11 francs per hundred kilograms, freight and insurance included, while American corn, under the same conditions, costs 15 cents per hundred kilograms above that figure. This disparity of market values is probably only temporary, as the Danubian supply is limited and its quality inferior to that of the American maize. It would appear natural that the enhanced cost of wheat bread would increase the consumption of untaxed and cheap maize as human food, but so conservative are the French people in all that concerns their diet and drink, so devoted are they to wheaten bread, that it is not probable they will accept any substitute, however advantageous in point of price.

NOTES.

Ramie culture in Spain.—Her Britannic Majesty's consul at Barcelona writes as follows:

Agriculturists in the Gerona district have lately been turning their attention seriously to the cultivation of the ramie plant, commonly called China grass, I believe. For some years past, in consequence of the destructive inroads of the phylloxera and other pests among the vineyards, and of the increasing importation of cereals from America and elsewhere, the cultivation of the vine and cereals has ceased to be as profitable as formerly in that part of Gerona, and finding that the climate and soil are in every way suited to the cultivation of this grass, and that the few essays that have been made have resulted in success, a factory for decortication has been erected near the plantation, its inauguration, although created and carried out under foreign (French) auspices, having been attended by the notables of Catalonia. Hitherto the roads from the above district have been but dry beds of torrents, which prevented conveyance of produce to any distant market. Now it appears the roads are to be leveled and made passable. It is said that this plant is destined to replace not only the hemp and flax which are imported from France for the manufacture of textiles in Barcelona, but even cotton. The plant at present grown belongs to the family of the *Urticacæ*, and grows to a height of from 60 to 90 inches. It is essentially a textile plant, and two cuttings may be made in the year and cultivated under good conditions. A hectare would grow from 3,000 to 10,000 kilograms of stalks. At present there are few or no reaping-machines in that part of Spain; but as labor is cheap the weeding and pulling of the crop are done without much expense.

The plantations at Torroella de Montgú, the district of Gerona in question, have an extent of 130 hectares; but there is land disposable for the culture extending over 3,000 hectares. The price of ramie to-day is 10 pesetas [8s.] the 100 kilos. There are three decorticating machines at work, moved by a steam engine of 15 horse-power. It decorticates 215 kilos of stem in twelve hours, from which are obtained 43 kilos of thread, requiring but two workmen to manage each machine—one to introduce the stalks and the other to receive the fiber—and the expense is 12 pesetas [50 cents] per 150 kilograms of thread per diem. The society to which the plantations and factories belong is the *Société de la Ramie Française*, founded in 1882, with a capital of 3,360,000 francs.

The advantage of the ramie over other textiles rests in its great resistance to wear, three times greater than that of hemp, and from its greater length is more flexible, and has the property of color, assimilating itself to silk.

The following shows the conditions of the fiber of this plant in comparison with other textile productions:

Textiles.	Length.	Width.	Thickness.	Resistance.		
				Attraction.	Rupture.	Torsion.
	Meters.	Millimeter.	Millimeter.			
Ramie	0.50	.6	.07	100	100	100
Linen	0.05	.3	.03	25	66	30
Hemp	0.05	.5	.03	36	75	95
Cotton	0.06	.4	.05	12	100	400
Silk	1.00	.2	.01	13	400	600

Thread produced can be manufactured into the following articles, viz: Blonds, and hangings, the punto cloth, the finest blankets

An examination of the record shows that there were produced during the past season, in the neighborhood of Toulon and Marseilles, more than 5,000,000 flowering bulbs, as follows:

Hyacinths:	
Early White Roman	4,000,000
Early Blue	50,000
Tender Rose	150,000
White Italian	50,000
Narcissus:	
Paper White (<i>Lotus albus</i>)	500,000
Constantinople or Double Roman	150,000
<i>Lilium candidum</i>	250,000
<i>Anemone fulgens</i>	100,000
	5,250,000

Of this immense product the larger part has been exported to the United States, one dealer, who operates exclusively for the American market, having purchased more than two-thirds of the entire crop of last season. But for commercial reasons a certain mystery is woven about the origin of this merchandise.

The American demand is for "Dutch" bulbs, and, accordingly, a large part of those grown in this district are either sold to exporters in Antwerp and Amsterdam or are shipped via those ports to the United States in order to give them the appearance of Dutch origin. So far is this regard for appearances carried that some American importers insist that their correspondents in this district shall not only ship their bulbs via Holland and Belgium and so manipulate their consular invoices as to conceal their real origin, but they even require that these Southern French bulb-growers and dealers shall refrain from advertising their business in the United States. But notwithstanding these subterfuges the business of bulb-growing is profitable and rapidly increasing in this section, where the culture of immortelles is rather on the decline.

Two reasons are assigned for this. The first of these is the fact that in the departments of Var and Gard, where immortelles have been cultivated for generations on the same dry, gravelly slopes, the soil has become fatigued and the plants degenerate in vitality. Consequently the yield of the two or three last seasons has not been up to the mark of former years. But the most serious fact that affects the immortelle industry is the substitution, during recent years, in this country at least, of artificial wreaths and *couronnes*, made of glass, wire, and porcelain, which subserve more cheaply, because more permanently, the purposes for which immortelles were formerly exclusively used in memorial decorations.

In consequence of this the value of immortelles has declined, notwithstanding the diminishing supply, to about half the price of ten years ago, and the culture is no longer profitable.

Trade of Belgium in 1884, 1885, and 1886.—Consul Robertson, of Verviers and Liège, transmits the following under date of March 10, 1887:

Importations and exportations of wool and woollen goods into and from the Kingdom of Belgium during the years 1886, 1885, and 1884.

The movement of cotton in Europe.—Consul Catlin, of Zurich, writes as follows under date of March 1, 1887:

The following tabulated statement, showing the stock on hand, importations, and consumption of cotton in Europe, from October 1, 1885, to January 31, 1887, has been kindly furnished me by Mr. Eugen Zeiz, a competent and well-known cotton agent of this city:

Kind.	Stock on hand Oct. 1—		Imports from Oct. 1, to Jan. 31—	
	1885.	1886.	1885-'86.	1886-'87.
American.....	<i>Bales.</i> 462,340	<i>Bales.</i> 306,730	<i>Bales.</i> 1,973,610	<i>Bales.</i> 2,305,380
Brazilian.....	50,040	30,720	69,970	109,480
Egyptian.....	49,350	19,270	223,650	257,540
Levantine.....	4,330	7,444	20,240	20,660
West Indian.....	30,400	28,070	21,450	18,110
East Indian.....	149,800	222,660	130,440	170,920
Total.....	746,260	614,890	2,439,360	2,882,090

Kind.	Consumption from Oct. 1 to Jan. 31—		Stock on hand Jan. 31—		Imports from Feb. 1 to Sept. 30—	Consump- tion from Feb. 1 to Sept. 30—
	1885-'86.	1886-'87.	1886.	1887.		
American.....	<i>Bales.</i> 1,727,170	<i>Bales.</i> 1,738,800	<i>Bales.</i> 708,780	<i>Bales.</i> 873,310	<i>Bales.</i> 2,310,350	<i>Bales.</i> 2,712,400
Brazilian.....	74,230	100,350	45,780	39,850	110,840	125,900
Egyptian.....	201,540	203,450	71,460	73,360	169,020	221,210
Levantine.....	18,070	22,300	6,500	5,800	33,600	32,660
West Indian.....	20,930	19,910	30,920	26,270	51,400	54,250
East Indian.....	211,820	248,340	68,420	145,240	1,168,490	1,014,250
Total.....	2,253,760	2,333,150	931,860	1,163,830	3,843,700	4,160,670

Prices in Liverpool on the 10th of February, 1886 and 1887, were as follows:

Quality.	1887.	1886.
Middling, Orleans.....	<i>d.</i> 5½	<i>d.</i> 5
Middling, Upland.....	5½	4½
Good fair, Egyptian.....	6½	5½
Good Broach.....	4½	4½
Good Dhollerah.....	4½	4½
Good Oomra.....	4½	4½

"In case," concludes Mr. Zeiz, "the American crop does not exceed 6,200,000 or 6,300,000 bales, as is now variously estimated, prices will undergo no perceptible rise during the present season."

Petroleum in Greece.—Consul Moffett, of Athens, writes as follows, under date of February 3, 1887:

A shipment of petroleum, consisting of 6,200 cases, to the order of the Greek Government, for the petroleum monopoly, has just been received at the Black Sea, and is now being discharged at the same place.

NOTES.

The total consumption of petroleum in Greece last year was about 150,000 cases, all of which was imported from the United States.

If American exporters are not willing to lose their hold on this market, immediate steps must be taken to reduce the cost of transportation, and, I would add, TO IMPROVE THE QUALITY of the oil sent here.

Free ports in British West Indies.—Consul T. J. McLain, jr., of Nassau, N. P., writes as follows under date of March 26, 1887:

By order of the governor in council, the following places have been made ports of entry of this colony between the 20th day of April and the 20th day of August, 1887, viz: Arthur's Town and Port Howe, in the island of San Salvador; Tarpum Bay and Gregory Town, in the island of Eleuthera.

This temporary arrangement has been made for the convenience of fruit-vessels desiring to clear for United States ports during the pineapple season.

The wine trade of Bordeaux for the years 1884, 1885, and 1886.—Consul Roosevelt, of Bordeaux, writes as follows, under date of March 10, 1887:

Notwithstanding the plagues that continue to devastate the vineyards of France the commerce in wine does not retrograde, but on the contrary yearly increases. The following tabulated statement shows the importations and exportations of wines at Bordeaux during the last three years:

Countries.	1884.	1885.	1886.	Total.

Peronospora on the Rhine—Commercial Agent Smith, of Mayence, writes as follows under date of March 7, 1887:

Another pest, as rapacious as the phylloxera, has made its appearance in the vineyards of Germany, threatening to accomplish on the Moselle and Rhine what the phylloxera has failed to effect. This is the peronospora, which did much damage last fall among the vineyards of the Moselle, and in a short time destroyed many bright prospects of a gratifying vintage. The experience of other lands has been that wherever the plague appears, in the succeeding year it ravages with increased violence, and the vine-dressers of the Moselle and Rhine are consequently filled with alarm for the future. It, too, is a raider across the border from France. The Chamber of Commerce at Coblenz has called the attention of the Government at Berlin to the pest, it is said, and asked if the simple remedy adopted on the banks of the Ohio in the United States to destroy the marauders, that is, the burning of the leaves upon which it has fixed its seat, cannot be ordered to be used by the police. This could not be tried last year, as the season was too far advanced when the scourge was discovered, but I suppose will be applied during the coming summer. The only effective application thus far known is the sprinkling of the under part of the infected leaves with a solution of 8 parts of sulphuric acid oxide of copper, 12 parts of lime, and 80 of water, but to this there is the great objection that the oxide of copper may have a bad effect upon the wine obtained from vines so treated. This, though, it is claimed, can be avoided by mixing 98 parts of water, 1 of sulphuric acid oxide of copper, and 1 of ammonia, together.

Russian Agricultural Exhibition.—Vice-Consul-General Prince, of St. Petersburg, writes as follows under date of March 19, 1887:

I am in receipt of a letter from the committee of the Agricultural Exhibition, which by permission of the minister of imperial domains is to be held this year at Kharkoff, from October 2 to October 22 (new style).

Foreign exhibitors are invited to supply two divisions of this exhibition, viz: Division I, cattle, horses, mules, asses, horned cattle, sheep, pigs, poultry, &c.; Division VI, agricultural machines and implements of every description.

Kharkoff being the center of the agricultural industry the exhibition is worthy of the notice of American manufacturers and exhibitors.

CONSULAR REPORTS

ON

COMMERCE, MANUFACTURES, ETC.

No. 79.--JUNE, 1887.

THE NATIVE SHEEP OF SOUTH AMERICA.

REPORT OF CONSUL BAKER.

Is it not strange, in a country like the Argentine Republic, the mountain slopes and fastnesses of whose interior provinces and territories are the native homes of several species of wool-producing animals of the very first order, that these animals should be almost entirely neglected, and the attention of those engaged in pastoral pursuits directed exclusively to the production of sheep whose stock was originally brought from Europe? On account of the admirable fitness of the pampas of the province of Buenos Ayres, both in respect to climate and natural grasses, for the raising of sheep, it is not surprising that that industry has in the last thirty years developed into such grand proportions, now furnishing nearly one-third of the wool clip of the world. But in the upper, and especially the Andine provinces, and in Patagonia, where there is a scarcity of nutritious grasses, thus rendering those regions, in the absence of cultivated crops, less capable of sustaining that "latest production of art," the modern sheep, it has seemed to me an inexcusable want of enterprise on the part of the people not to rear and propagate, for the wool or hair, the great flocks of native breeds that roamed the wilds of those parts of South America long before the Spanish merino had found its way to this country, and whose fleeces were so wonderfully utilized by the Incas of Peru in the manufacture of textile fabrics.

HOW THE NATIVES UTILIZED THEM.

At the time that the Spaniards first visited South America there were no animals in the country which exactly corresponded to the sheep of Europe; but they found in Peru and in the regions of the Andes several species of animals to which they gave the name of *carneros de la tierra*, but which

they originally came from. They used the llamas as beasts of burden, and they raised the alpacas especially for their fleeces, rarely using them for carrying-purposes. The other two varieties, the guanaco and the vicuña, were then, as they are still, always found in a wild state, and were seldom domesticated.

Prescott, in his Conquest of Peru, gives an interesting account of the uses which the ancient Peruvians made of these native sheep. He says:

* * * But from the llama and the kindred species of Peruvian sheep they obtained a fleece adapted to the colder climate of the table-land, "more estimable," to quote the language of a well-informed writer, "than the fur of the Canadian beaver, the fleece of the *brebis des Calmouks*, or of the Syrian goat."

Of the four varieties of the Peruvian sheep, the llama, the one most familiarly known, is the least valuable on account of its wool. It is chiefly employed as a beast of burden, for which, although it is somewhat larger than any of the other varieties, its diminutive size and strength would seem to disqualify it. It carries a load of a little more than a hundred pounds, and cannot travel over 3 or 4 leagues in a day. But all this is compensated by the little care and cost required for its management and its grow scantily along the withered sides and steep slopes of the Cordilleras. The structure of its stomach, like that of the camel, is such as to enable it to dispense with any supply of water for weeks, nay, months together. Its spongy hoof, armed with a claw or pointed talon, to enable it to take secure hold on the ice, never requires to be shod, and the load, laid upon its back, rests securely in its bed of wool, without the aid of girth or saddle.

The llamas move in troops of five hundred or even a thousand, and thus, though each individual carries but little, the aggregate is considerable. The whole caravan travels on at its regular pace, passing the night in the open air, without suffering from the coldest temperature, and marching in perfect order and in obedience to the voice of the driver. It is only when overloaded that the spirited little animal refuses to stir; and neither blows nor caresses can induce him to rise from the ground. He is as sturdy in asserting his rights on this occasion as he is usually docile and unresisting. * * *

Yet the ancient Peruvians seem to have valued the llama, in common with the other animals of that genus, chiefly for its fleece. Immense herds of these "large cattle," as they were called, and of the "smaller cattle," or alpacas, were held by the Government and placed under the direction of shepherds, who conducted them from one quarter of the country to another, according to the changes of the season. These migrations were regulated with all the precision with which the code of the *Mesta* determined the migrations of the vast merino flocks in Spain; and the Conquerors, when they landed in Peru, were amazed at finding a race of animals so similar to their own in properties and habits, and under the control of a system of legislation which might seem to have been imported from their native land. But the richest store of wool was obtained, not from the domesticated animals, but from the two other species, the guanacos and the vicuñas, which roamed in native freedom over the frozen ranges of the Cordilleras, where not unfrequently they might be seen scaling the snow-covered peaks, which no living thing inhabits save the condor, the huge bird of the Andes, whose broad pinions bear him up in the atmosphere to the height of more than 20,000 feet above the level of the sea. In these rugged pastures "the flock without a fold" finds sufficient subsistence in the *ychu*, a species of grass which is found scattered all along the great ridge of the Cordilleras from the equator to the southern limits of Patagonia. And as these limits define the territory traversed by the Peruvian sheep, which rarely, if ever, venture north of that line, it seems not improbable that this mysterious little plant is so important to their existence that the absence of it is the principal reason why they have not penetrated to the northern latitudes of Quito and New Granada.—(Vol. I, Book 1, Ch. V.)

from the same type. The llama and the alpaca are of various colors, and sometimes speckled. The guanaco and the vicuña are generally of a single color—brown, approaching to red. The llama and the alpaca are so resigned to their state of domesticity that they are scarcely able to take care of themselves or live in a wild state.* The guanaco and the vicuña prefer the wild state, but they are very susceptible of being domesticated. The Jesuits, who established their missions in this part of South America very shortly after its discovery, were the first to tame and domesticate the two latter animals, and the first also who undertook to cross them, which they did for the peculiar wool which the cross produced.

NOT FOUND NORTH OF ECUADOR.

Although these animals are all indigenous to the Cordilleras of the Andes, none of them are found north of Ecuador, neither in Quito, Bogota, nor Caracas, where the climate is quite analogous to that of Peru or the Argentine Republic. The guanacos are especially found in the extreme southwestern portions of the province of Buenos Ayres

LLAMA.

and in the desert ranges of Patagonia as far south as the Straits of Magellan. There they are the principal food of the Indians, their skins being used for clothing and for coverings for their wigwams (*toldos*). The Chilians and the Auricanian Indians also

NATIVE SHEEP OF SOUTH AMERICA.

modified by the climate, and which they formerly used as a beast of burden, but the use of which has in a great measure been superseded by the introduction of mules.

THE LLAMA.*

Of these several varieties of native sheep the largest and strongest is the llama (*Camelus llama*). It was especially esteemed by the native inhabitants as a beast of burden. Its load is about 100 pounds, though for short distances it is able to carry considerably more. Its height is from 4 to 5 feet, and the length of its body is about the same. It has a neck resembling somewhat that of the camel, and it carries its head in the same manner, thus making it look taller than it really is. It has no horns nor hump. Its hoofs are cloven, and it ruminates, or chews its cud. Its eyes are large and long, very black and prominent, but with a most soft and gentle expression. Its nostrils are wide and high. Its upper lip is divided like that of the camel, and it shows its teeth when it eats; its lower lip hangs slightly. In its upper jaw it has neither incisor nor canine teeth, but in the lower one it has six incisors and two canines; it has five molar teeth on each side of both jaws. When it walks it carries its ears forward like a horse that is frightened; when it is lying down they fall backward; its ears are sharp-pointed and about 4 inches long, and are fringed with white hair. Its neck is from 2 to 2½ feet long, slightly curved, and with a graceful movement very much like that of the swan. Its body is shaped quite like that of the deer, with clean, slender legs, its cloven hoofs ending in talons or claws like those of a bird of prey. Under its breast, over the sternum, there is a hard, callous substance about 6 inches long and 3 inches wide, on which it sleeps or rests. When it wishes to lie down it doubles its feet under its body and falls on this callous substance with a sensible noise, very much as the camel does, from which circumstance some argue that nature intended the animal for a beast of burden. Its tail is from 8 to 10 inches long and very woolly. The llama is covered with a very fine silky hair or wool, which is not shed like that of the camel, but when properly cared for grows to a length of from 3 to 4 inches. The finest is on its legs. On the body the wool is of various colors, but under the belly it is always white. It neither has the dirt nor the grease which the fleece of a sheep possesses, and though it is not so esteemed as that of the alpaca, that portion which is taken from the loins fully rivals it in silkiness and softness. The animal rarely produces more than one young at a time, the period of gestation being six months, and it comes to maturity at three years of age. When it is angry it spits an acrid matter, and can thus project it to a considerable distance; but it does not bite.

The Indians are very fond of the meat, esteeming it beyond that of any other animal. They dry it in quantities, and they esteem the soup made from it as a sovereign remedy in nearly all cases of sickness. The skin of the llama is solemn and majestic, and it is wonderfully sure-making a false step in the mountain passes, even when they are thus loaded,

longer than three or four years, in consequence of infirmity caused by the sulphurous and arsenious exhalations. In the past, in the far interior, these beasts of burden could be seen in troops of five hundred, but it is now a rarity to see a hundred together. They exhibit great affection for the person who takes care of them, and after an absence will bleat and make wonderful demonstrations of joy at seeing him.

THE ALPACA.

The size of the alpaca (*Camelus alpaca*) is a little less than that of the llama, its height being about 4 feet, the length of its body being the same. Its neck is neither so long nor so delicate, nor does it possess the noble presence of the llama, though it is not an uninteresting animal. The appearance of its body when the fleece has been removed is very similar to that of the llama. Like it, the upper lip is divided, and it shows its teeth when it eats, as also its gums, which are as black as ebony. Its head looks more like that of the sheep, except

ALPACA.

that it always keeps its ears pointed forward. Its nose, however, is black, like that of the llama, but it is not so long nor so sharp-pointed, nor are its nostrils so dilated nor so high up. Its hind legs are shorter than its fore ones and are somewhat curved. Its hoofs are cloven, but the claws are very small. It also has a callous spot on its breast, but it is small. Its tail is very bushy. It is a ruminant, and does not possess the habit of

esteemed, and this makes it the most valuable of the South American native sheep. The wool is long, soft, and abundant, being double the amount which the other varieties afford. On its sides, breast, and back its fleece is from 8 to 16 inches long. It is of various colors and sometimes speckled. Outside of the wool, and somewhat protecting it, is a long hair, which is exceedingly fine, so that the fleece is really a combination of hair and wool. It is sheared by the Indians twice a year—in June and December.

THE GUANACO.

The guanaco (*Camelus huanacus*) is $3\frac{1}{2}$ to 4 feet in length by about $4\frac{1}{2}$ feet in height. Except in a few rare cases, it is always found in the wild state. When young it is, however, very easily tamed; when old it is impossible. It is always of the same color, a brownish red. In its general appearance it resembles the llama, the most notable differences being a greater curvature of the back, a more shaggy fleece, and smaller feet. Its head is more oval and not so large. It also lacks the callous spot on its breast, and its nostrils are small. Its upper lip is split and it has the teeth of the llama, and, like it, it has the habit of spitting. Its disposition and habits, however, are very different, and show that the guanaco is of a different race. There is no European animal which so much resembles it as the grayhound, and, like it, its

them under foot in its efforts to escape. It is gregarious, and it is generally seen in droves or flocks of from two to three hundred. They are vigilant and exceedingly circumspect in their movements, and when feeding place one of their number as a sentinel to announce the arrival of an enemy. The flocks which are now to be seen on the frontiers have generally a very large excess of males, for the reason that being stronger and swifter of foot than the females, and perhaps lacking that curiosity which induces the latter to approach too near to a point of danger, they more readily escape the toils of the hunters.

Darwin, in his *Voyage of a Naturalist Around the World* (p. 166), gives the following very interesting account of the guanaco and its habits, viz:

The guanaco, or wild llama, is the characteristic quadruped of the plains of Patagonia. It is the South American representative of the camel of the East. It is an elegant animal in a state of nature, with a long, sleek neck and fine legs. It is very common over the whole of the temperate parts of the continent as far south as the islands near Cape Horn. It generally lives in small herds of from a half a dozen to thirty in each, but on the banks of the Santa Cruz we saw one herd which must have contained five hundred at least.

They are generally wild and extremely wary. Mr. Stokes told me that one day he saw through a glass a herd of these animals which evidently had been frightened and were running away at full speed, although their distance was so great that he could not distinguish them with the naked eye. The sportsman frequently receives the first notice of their presence by hearing from a long distance their peculiar shrill, neighing note of alarm. If he then looks attentively he will probably see the herd standing in a line on the side of some distant hill. On approaching nearer a few more squeals are given, and off they set at an apparently slow but really quick canter along some narrow beaten track to a neighboring hill. If, however, by chance he meets a single animal or several together they will generally stand motionless and intently gaze at him, then perhaps move on a few yards, turn around, and gaze again. What is the cause of this difference in their shyness? Do they mistake a man in the distance for their chief enemy, the puma, or does curiosity overcome their timidity? That they are curious is certain, for if a person lies on the ground and plays strange antics, such as throwing his feet up in the air, they will almost always approach by degrees to reconnoiter him. It was an artifice that was frequently practiced by our sportsmen with success, and it had moreover the advantage of allowing several shots to be fired, which were all taken as parts of the performance.

On the mountains of Tierra del Fuego I have more than once seen a guanaco, on being approached, not only neigh and squeal, but prance and leap about in the most ridiculous manner, apparently in defiance of a challenge. These animals are very easily domesticated; and I have seen some thus kept near a house in Patagonia, though under no restraint whatever. They are in this state very bold and readily attack a man by striking him from behind with both knees. It is asserted that the motive for these attacks is jealousy on account of their females. The wild guanacos, however, have no idea of defense; even a single dog will secure one of these large animals until the huntsman comes up. In many of their habits they are like sheep in a flock. Thus when they see men approaching in several directions on horseback they soon become bewildered and know not which way to run. This greatly facilitates the Indian way of hunting, for they are thus easily driven to a central point and are encompassed.

The guanacos readily take to the water; several times at Port Valdes they were seen swimming from island to island. Byron, in his *Voyage*, says he saw them drinking salt water. Some of our officers likewise saw a herd apparently drinking the briny fluid from a salina near Cape Blanco. I imagine in several parts of the country if they do not drink salt water they drink none at all. In the middle of the day they frequently roll in the dust in saucer-shaped hollows. The males fight together. Two one day passed quite close to me, squealing and trying to bite each other, and several were shot with their hides deeply scored. Herds sometimes appear to set out on exploring parties. At Bahia Blanca, where within 30 miles of the coast these animals are exceedingly infrequent, I one day saw the track of a herd which had come in a direct line to a point of land where they were received by a small flock of guanacos.

THE VICUÑA.

The vicuña (*Camelus vicuña*, Linné) is the smallest and most delicately formed of any of the native sheep, but its wool is the finest, and on that account it is the most interesting and highly prized. Its height is only about $3\frac{1}{2}$ feet and $2\frac{1}{2}$ in length, and its body is much lighter. It only weighs from 75 to 100 pounds, while the llama weighs 250. In its general form and appearance, however, it corresponds to the other varieties. Its head seems large for the size of its body and is more oval, but it runs almost to a point, its snout being quite sharp, thus making its upper lip, which is divided, and its mouth very small. Its head, however, is erect, and is covered with wool of a reddish color, which is also the color of the fleece. Its nostrils and teeth are also small, and its upper gums are black. Its ears are sharp-pointed and stand erect, and its neck, where it joins the body, forms quite a depression. It has no callous spot on its breast. Its legs are delicate and seem very long, compared with the size of its body. Its feet are small. Its wool is the finest, the softest, and the most silky that is known, and when it has been cleared of the hair which grows with it, it is regarded as the most valuable in the world. The wool on the back is without any mixture of hair, while on the rest of the body it is even longer than the wool, thus somewhat protecting it. The wool on the belly is white.

VICUÑA.

The vicuña does not possess the gracefulness of the other classes of native sheep. It lacks the majestic appearance of the llama, the soft and expressive look of the alpaca, or the independent and lively carriage of the guanaco. Its eyes are black, but without expression, rather round than oblong, and as the pupil occupies all the iris, it gives but drinks very little water. It is gre-

this province, an Irishman, for many years a sheep-farmer on a large scale, and who made a scientific study of the best ways and means of refining the wools of the Argentine Republic, took likewise an enthusiastic interest in the native varieties of sheep, which he also raised on his *estancia*. From a paper which he prepared on the subject of these wools I give the following as his estimate of them:

WOOL OF THE LLAMA.

It is what is called ordinary, long, mixed with hair, very flaccid, and lacking elasticity; generally hazel-colored, but the belly-wool is always white. It lacks the oil and dirt of that of the ordinary sheep. It is not exported from the country, but it is manufactured by means of hand looms in the interior into blankets and coarse woollens.

WOOL OF THE ALPACA.

This wool, which is generally black, is very long, sometimes growing to the length of 12 inches and more. It is somewhat wavy, but of the class which in this market is called smooth (*lisa*). It does not possess the property of felting or of being fulled, except in a very imperfect manner. It is very elastic, but takes color with difficulty, and only after being very thoroughly scoured. It is soft, silky, and lustrous, which characteristics it does not lose upon being colored. It is liable to break under the comb, but this probably arises from its extreme length and the fineness of the fiber. There are still considerable quantities of this wool sent to Europe, but the greater part of the annual yield is manufactured here in the country, the wool being in great repute for making blankets, rugs, carpets, and various species of cloth.

WOOL OF THE GUANACO.

This is at present only obtained from the skins of the wild animals after being trapped and killed. It is of the same nature and color as that of the vicuña; but with this difference, that it is shorter, coarser, and of a color which is not so strong. Besides, it is so mixed with hair as to lose considerable of its value. It is also so dirty and so full of scurf as to make it sometimes quite unmerchantable; but this perhaps is not the result of any infirmity in the animal, but on account of its having been taken at an improper time for the wool. But when thoroughly scoured the wool is very fine and soft, and is greatly employed in the manufacture of hats. A thick muslin is also manufactured from it, quite impervious to water, which is used for umbrellas. Considerable quantities are exported to Europe, where it is greatly esteemed. It would be greatly improved if the wool were separated according to its qualities and assorted as is done with that of the vicuña.

WOOL OF THE VICUÑA.

It is of a very fast color and exceedingly appreciated on account of its fineness and the silkiness of its touch. Indeed it gives a fleece more valuable than that of any other animal in the world—"more estimable," as has been truly said, "than the fur of the Canadian beaver, the fleece of the *brebis des Calmouks*, or of the Syrian goat." The wool is finer than that of Cachemire or of the goat of Bucharia. Perhaps its only defect is the color; and even yet the secret of giving it any other color than black has not been discovered in Europe, although the Indians of Peru managed to give it most brilliant colors. One inconvenience in regard to this wool is that it is more or less mixed with hair, but this could be readily obviated if the animal was properly domesticated and refined. It has the property of being felted and fulled in a very remarkable degree. If this wool could be produced *white* it would be almost invaluable. The diameter of the fiber is as follows: On the back, 7 to 8 degrees; on the neck, 5 to 6 degrees; on the legs, 8 degrees, eirometer of Dolland. Wool of the neck $\frac{10.500}{10.000}$ to $\frac{10.600}{10.000}$ of an inch; of the back, $\frac{10.700}{10.000}$ to $\frac{10.800}{10.000}$ of an inch; of the leg, $\frac{10.800}{10.000}$ of an inch; the red hair on the back $\frac{10.350}{10.000}$, and the white hair of the belly, $\frac{10.200}{10.000}$ to $\frac{10.300}{10.000}$ of an inch.

NATIVE MANUFACTURES OF THESE WOOLS.

Not a great quantity of the wool of any of these animals is shinned from the country; the exact amount however is not known for the reason that the

Some of these fabrics are a marvel to all who examine them. By separating the filaments of different tints of the vicuña wool, and making threads of them with the spindle, they are enabled, by means of a common hand-loom, to weave a cloth which, aside from the striking arrangement of its colors, is far superior in closeness of texture to the best woolens of commerce. The best of these native fabrics are made in Catamarca and some of the other upper provinces, but not in quantities to meet the demand. The principal merit of these native ponchos, shawls, &c., is that they are entirely impervious to water, at the same time that they are light and fine; and they readily command exorbitant prices, ranging from one to five hundred dollars, gold, according to their finish, thus quite rivaling the camel's-hair shawls. To make them, however, is the work of many months of exacting, hard labor. As the hunting of the vicuñas is somewhat difficult, and they are becoming somewhat scarce on account of the recklessness with which they are slaughtered, the price must soon go even beyond these figures.

DOMESTICATION AND REFINEMENT OF NATIVE SHEEP.

In regard to the domestication of these animals and the refining and improving of their fleeces by a proper system of breeding, there seems to be no question. So far as the llama and the alpaca are concerned, the ease with which they are domesticated is historical. When the Spanish invaders conquered the country they found both of these animals in the service of the natives, either employed as beasts of burden or carefully attended under the direction of shepherds for the fleeces which they furnished. They are still to be seen domesticated in flocks through Peru, Bolivia, and some of the Andine provinces of the Argentine Republic, cared for and folded just as the European variety is here. It is true, however, that they have been greatly superseded as beasts of burden by the mule, and as wool-producing animals by the modern sheep. No particular pains have ever been taken to domesticate the guanaco and the vicuña; but the efforts of the early Jesuits in this line prove the easy success with which it can be done. The ancient Peruvians do not seem to have tamed them, but, although they roamed in a wild state, it was not permitted to kill them, except under certain conditions, but in the proper season the great flocks which were found in the mountain passes were surrounded, carefully captured, sheared, and then allowed to go free again.

Prescott, in a very graphic manner, informs us how these great hunting expeditions were managed. In his *Conquest of Peru*, Vol. I, page 147, he says:

Although roaming without a master over the boundless wastes of the Cordilleras, the Peruvian peasant was never allowed to hunt these wild animals, which were protected by laws as severe as were the sleek herds that grazed on the more cultivated slopes of the plateau. The wild game of the forest and the mountain was as much the property of the Government as if it had been inclosed in a park or penned within a fold. It was only on stated occasions, at the great hunts, which took place once a year, under the personal superintendence of the Inca, or his principal officers, that the game was allowed to be taken. These hunts were not repeated in the same year, but were held in four years. At the appointed time all

their solitary haunts among the mountains. The wool thus collected was deposited in the royal magazines, whence in due time it was dealt out to the people. The coarser quality was worked up into garments for their own use, and the finer for the Inca; for none but an Inca noble could wear the fine fabric of the vicuña.

On the subject of domesticating these native sheep I translate the following from what Mr. Harratt has written :

Experience has taught us that every wild animal, provided he is not very savage or provided by nature with facilities for his own protection, can be tamed and even domesticated. We have in the vicuña and other varieties of the South American sheep an illustration of this fact. When any of these animals are taken very young they can be tamed without the least difficulty. Up to the present time no attempts have been made to form very large flocks of them, at least not since the Jesuits were expelled from the country. I know, however, that a sheep farmer in Quillota, in the Republic of Chili, for an experiment, tamed twenty guanacos, which would every morning go out to graze and return at night unattended. Once tamed, the animals in their successive generations continued in the same domestic state. The Jesuits at the time of their expulsion had six hundred tame vicuñas, and had they remained in the country the domestication of these animals would have been an assured fact.

The annual shearing of the vicuña, without any other attention, would cause a great improvement in the wool, making the fleece much more regular and even, and thus it would lose much of the hair which grows with it, the value of the fleece being greatly enhanced thereby. The wool of the alpaca, now so little cared for, also admits of great improvement and is deserving of attention. Since time immemorial the Indian has preferred a black color and to have his clothing black, but it is equally as easy to raise white alpacas as white sheep, and in the same manner and by a similar treatment it is equally easy to cause the hair to entirely disappear from the fleece, which would increase the value of the wool threefold. Spain set the example of crossing the breeds of sheep in order to improve the quality of the wool over two thousand years ago, and Columela has immortalized his name by what he has done in this respect by establishing a breed of sheep which has extended over the entire world. The Spaniards, however, seem to have lost their enterprise, and have allowed other nations to surpass them; at least they have left for other nations and future times the improvement which can be made in the quality of wool by the crossing of sheep with the vicuña.

Art and the experiments of man have made great modifications in the productions of nature; and in no department of science have there been greater advances made than in that of the crossing of different classes of animals, by which the hybrid becomes more valuable than the original stock. We know by experiment that the fleece of the alpaca crossed with the male of the guanaco, or that of the llama crossed in the same way, is a great improvement on the original alpaca or llama. We also know that by crossing a white llama with a red guanaco the foal becomes white. The native sheep do not belong to the same genus that the camel does, although many persons think so; or, at least, they partake equally of the properties of the sheep. The vicuña is not larger than some merino sheep, produces wool, is timid and inoffensive; has the same bleat, and in the same manner strikes the ground with its foot when it is enraged. Why is not the alpaca equally susceptible of improvement? Although it is not possible, without further experiments, to know the full effect of crossing the alpaca with the modern sheep, it is not to be doubted, from what we already know, that a breed could be produced which would exhibit a great improvement in the qualities of the fleece. We all know what Bakewell has done in this respect, by selecting the most perfect individuals of the same family for breeding purposes, and it seems almost certain that every class of animals, domestic or wild, is susceptible of improvement. Thus, the hair can be made to disappear from the fleece of the vicuña by selecting animals for propagation which have but little hair upon their bodies. And as the rule is general that the offspring partake of the peculiarities and characteristics of their parents, the quantity of the hair would go on decreasing in successive generations, until it disappeared altogether. And in all probability it would be equally easy to produce white wool from the vicuña, for that animal is not unfrequently of that color.

GENERAL INDIFFERENCE ON THE SUBJECT.

While these are the views

the only sheep which occupy its great natural pastures are the European varieties. Except in the *quintas* of wealthy proprietors or in the paddocks of the public parks, but little is now seen of the native sheep which once had the exclusive range of the vast pampas of this part of South America. In the wilds of Patagonia and in the fastnesses of the Andes what remain of these remarkable animals are now almost exclusively to be found. In the upper provinces and in Peru and Bolivia they are occasionally to be met with in a domestic state, and sometimes, especially the llama and the alpaca, in considerable numbers; but no efforts are made to improve their condition or the quality of their wools. The business requires more patience and a greater amount of scientific labor than the rude natives and half-breeds of the far interior are qualified to bestow upon it. As were their fathers before them, they are content with the mere raising of these native sheep. The wool mixed with hair which they obtain from their shearings is amply sufficient to meet the wants and conditions of their primitive mode of life, and they are too indolent to make experiments about a matter in regard to which they are utterly indifferent. And so, unless a new and more investigating race of men come in to take advantage of the situation, nothing will ever be done here in the country for the refinement of these native breeds of sheep.

ACCLIMATIZATION OF THE ANIMALS ELSEWHERE.

Whether these animals would bear a transfer to other countries, where they might be better appreciated, is a question which does not appear to be fully settled. I believe, however, that through the efforts of naturalists they are now to be found in some of the parks and zoological gardens of the large cities of Europe and the United States, though in those places they are only kept for show. This, however, would seem to prove that they can be acclimatized. In examining the files of an old paper a short time ago, I saw a notice that a Mr. A. J. Duffield, an Englishman, had greatly interested himself in the native sheep of this part of South America, and was then undertaking the experiment of transporting a flock of alpacas to Australia. A letter of his on the subject, written from Potosi nearly twenty years ago, gives a great amount of information as to these animals, and is as accurate in description and detail as though it were just written. It is so full of interest that I made a copy of it, and give it below:

MR. DUFFIELD'S LABORS.

POTOSI, November 25, 1862.

MY DEAR SIR: I wrote you in July last from the desert of Atacama, the dangers and miseries of which, to one who has hardly seen the bush, much less lived in it, were almost insupportable. I was, however, saved from the danger of leaving my bones to whiten in its burning sand by a little pluck on my part and great intelligence and endurance on the part of my mule—an animal the value of which is hardly known in our part of Europe and which for purposes of exploration in Australia would be invaluable. You will hardly credit it, but my mule was nearly three days and two nights without taking water and twenty-four hours without food; and she carried me for those forty hours at an average rate of 6 miles an hour. In the heat of Atacama, I met llamas everywhere, and was

They had, however, been allowed a promiscuous intercourse with the llamas, and it was easy to see at a glance how much of grace and symmetry the animal had lost by the connection, to say nothing of the great damage done to the quality of the wool. From what I remember of this family in the royal park of Melbourne, I have very serious doubts whether you have any pure alpacas in Victoria, or if one or two males, they are of very inferior breed.

What has pleased me and rewarded me most for the horrible journeys I have passed is in being able to verify by personal observation the important fact that the alpaca will live and thrive in the hottest and coldest climates, enduring all rigors and trials of the most rapid change from one extreme to the other, provided the climate be dry. Here, from the coast to the peak of the Silver Cerro of this once silver city, a height of more than 16,000 feet, the air is so dry and so charged with electricity that your hair goes off in small shocks when you comb it. Even in the rainy season, which continues four or five months, this quality of the atmosphere continues, so much so that on the snowy heights of Cura Guara or the slopes of the highest range of the Andes the cold is not so penetrating or trying as it is in London in the month of November. Although the city of Potosi is at an elevation of some 14,000 feet above the level of the sea, you never see a fire or a stove in any house in the coldest season; and though you experience all the four European seasons of spring, summer, autumn, and winter in one day and every day of the year in this extraordinary city, the rapidity and violence of these changes produce no ill effects on the health of man or the inferior animals. In spite of the peculiar dryness of the atmosphere, which now appears necessary to the cultivation of alpacas, there was a time when the Peruvians were amongst the first agriculturists of their age, when the alpaca browsed in the moist and filthy atmosphere of the Peruvian coast; and if this intelligent and valuable animal could live and thrive there, there is no part of Australia or New Zealand where it would not equally live and thrive.

If you could only see the hot sandy desert where I met with these animals, or the bleak, barren, and horribly desolate mountains which they climb in search of a very precarious living for eight months in the year, you would wonder how these creatures live. Here and there they will find a few dry ferns, growing between barren rocks, or sheltered from the scorching heat between large stones. The ice plant and its relations, with a few other green things, that only just peep out of the earth, and which no sheep could nibble, form the chief food—together with any hardy shrub which the Indian has not cut down for fire-wood—for the alpaca. In short they will live where a sheep would die, and one of the great benefits which this animal will confer upon Australia will be to make as valuable in the fullness of time its waste, unconquered, and almost impenetrable lands as its glorious, broad agricultural plains.

The flesh of the alpaca and llama requires to be known before any one who has not tasted it can believe in its flavor. One of my friends, at whose house I spent a few days in the desert, was greatly concerned on finding on the day of my arrival that the only joint for dinner was the choice cut of a llama. He said nothing until dinner was over and then "hoped I had dined well." The truth is I had been served twice to this Indian fare without knowing whether I was eating fine mutton or luscious veal, for it had a dash of both. I ate llama all the time I was there, and everywhere I go I call for llama. It makes very good *charqui* (jerked beef), and the *caldo* or soup made from it is very fine. One thing is certain, I hope, that the world is not going to end its days on beef and mutton, and the sooner it can add a roast of llama or alpaca to its Christmas fare the better for us and it. * * *

I think I can now safely inform you that our expedition will set sail for Melbourne in March next. We have been retarded by the rains, and we must march through floods of water, otherwise we should get no food by the way for our flocks. We have secured a good number of pure whites and of the most valuable breed. This will become, if we have a prosperous voyage, the most valuable stock of which Victoria may boast. Our expenses and difficulties have been great, and it is yet uncertain if we shall ever be reimbursed or not; but I have no reason to despair or even complain. My friend, Mr. G. H. Williams, on whom the labor and responsibility of our enterprise have mainly rested, and to whom Australia will be indebted for pure alpacas, when they arrive there, has so far conducted it so admirably that I have no fear of the result.

WHAT WAS THE RESULT?

What was the "result"? What even he

world generally that its sequel were worth finding out. If the animals arrived in Melbourne—as the rearing of sheep has since fully monopolized the pastoral attention of the people of that country—it would seem that they after all did not answer the purposes or meet the success which was anticipated. But this, even if true, is not of itself sufficient to convince us that the acclimatization of these animals in other countries is impossible. The facts set forth in Mr. Duffield's letter, as to the hardness of the alpaca and other varieties of the South American sheep, are all that is needed to show that, under proper conditions, they can be reared elsewhere. Provided the climate is dry, no extremes of heat and cold, no sudden fluctuations of temperature, no coarseness or even scarcity of food, seem to affect these valuable animals.

COULD THE ANIMALS BE DOMICILED IN THE UNITED STATES?

I merely make the suggestion, that in these respects, if we had ransacked our inventiveness to describe an animal which should be pre-eminently adapted to some portions of our own country we could hardly have imagined a breed more suited than these South American sheep. I refer particularly to the desert portions of Texas, and of New Mexico and Arizona, whose arid soil and general scarcity of water are a great drawback to their proper development. Introduced under favorable circumstances, any or all these classes of animals might be able to fill an industrial gap in those regions which otherwise we can scarcely expect to find a filling for; and thus even the most unpromising portions of those Territories might in time attain to a development, through the valuable wools which these animals afford, that there else can be but little hope for, while in other parts of the country, wherever ordinary sheep may be produced, the introduction and acclimatization of these valuable wool-producing animals would give us a new source of national wealth.

GRADUAL EXTERMINATION OF THESE SHEEP.

Meanwhile, however, throughout the Argentine Republic, in the absence of any laws regulating the capture and killing of these native sheep, especially the guanacos and vicuñas, their numbers are rapidly becoming less and less; and at the rate at which they are at present annually hunted down, unless laws for their protection shall be enacted, it will not be many years before, like our own buffalo, they will in this part of South America become quite exterminated.

I translate the following from Señor Nap's *Republica Argentina*, page 304:

The attention given to the raising of llamas in this country is insignificant, although the mountain regions of our northern provinces form a part of their *habitat*. Only the province of Jujuy counts among its cattle 16,000 llamas, whose value is \$40,000 gold. Some intelligent *estancieros* of the littoral provinces—above all in Buenos Ayres—have latterly made some excellent attempts in their establishments to raise llamas as well as alpacas. It is to be deplored yet, even more than the neglect shown to whose wool is so fine and valuable, is hunted as its near extermi-

We ought, therefore, to expect that before long the act of killing a vicuña will be punished with all possible severity. It is sufficient to shear the animals when caught and thereafter place them at liberty, if it be not desirable to tame and breed them; but their butchery is an act of brutality which ought to be severely punished.

In Patagonia not merely the Indians but now also the settlers on the far frontiers are making sad havoc among them, if we may judge from the quantities of skins, rugs, and furs manufactured of strips of the guanaco pelts in colors called *quillangos*, which are sent to this point for a market. In the northwestern portions of the Argentine Republic this wholesale slaughter is not indulged in; the animals are too essential in the domestic economy of each family for any reckless destruction of them, while in Peru and Bolivia I believe there are laws for their protection. The llama and alpaca especially, being thoroughly domesticated, have the privileges and rights of household animals.

As I said at the beginning of this report, considering the marvelous excellence of the wools which these animals produce, the exquisite flavor of the meat they afford, the ease with which they can be domesticated, and the possibilities they offer for still greater refinement of their fleeces, it is strange that nothing whatever is done for their proper propagation and production.

E. L. BAKER,
Consul.

UNITED STATES CONSULATE,
Buenos Ayres, March 21, 1887.

GRASSES OF THE ARGENTINE PAMPAS.

REPORT OF CONSUL BAKER.

The wealth of the Argentine Republic consists in great part of its pastoral industry. There are in the country, according to the latest official estimate, 14,171,000 cows, 4,186,000 horses, and 70,910,000 sheep, whose total value is put at \$331,000,000, and yet it will surprise the cattlemen of the United States to learn that this immense number of animals, year in and year out, are never fed a mouthful of food, but feed themselves, and live, as best they may, entirely on the natural grasses which grow spontaneously. During the frosts of winter and the droughts of summer it is the same. The *estanciero* makes no provision for either, and his animals, running ever at large over his broad leagues of land, must accept the pasturage, whether it be better or worse, which they afford. It is an exceptional year, however, when his animals cannot, after some sort, "pull through" from one season to another.

EXTENT OF THE PASTURAGE.

What this pasturage signifies will be better understood when it is known that these natural grasses cover over 63,120 square leagues, against 645 square leagues devoted to crops and agriculture. to say, the area of the latter is not It were worth

Cattle are never stall-fed in this country. On this subject I find the following paragraph in the Buenos Ayres Herald of the 26th:

One of the necessities of the times is the fattening of cattle for meat. We have no beef worthy the name, while we have cattle so many that we cannot sell them. We hear of a lot of bullocks numbering a thousand which cannot be sold at \$11.50 per head, and yet we have dear beef and poor meat in this city. The cattle which reach us are unfit for food, but are good candidates for feeding, and if those who have lands near the city would go into the business of stall-feeding cattle for the market it would prove a good business, and our reasons for so saying are that the price of good beef is greater here than in the United States, where the price of land and of food is greater than here, and yet where they find it a good business to fatten cattle. It is time that we had done with calling skin and bones beef.

Cattle are now quoted for little more than the value of the hides, \$6 per head being a common price for native cattle.

Indeed there cannot be anything more exhilarating than to career on the back of a fine horse across these plains of Buenos Ayres on a bright clear morning, or in the cool of a summer afternoon, a cloudless sky of deep azure, an atmosphere marvelously light and pure, and a soft breeze communicating a sense of indescribable buoyancy, the vast plains, boundless as an ocean, inspiring an irresistible feeling of joyous freedom as it fades away in the distance. I may premise that the geological formation of these great pasture lands of the Argentine Republic, known to scientists as the Pampean, consists of a yellow calciferous clay, more or less mixed with sand and saline substances and capped with a rich alluvial deposit. The soil is entirely destitute of indigenous woody plants. I do not know of a single tree or bush that belongs to the pampa. Without natural trees, without ligneous plants, its chief characteristic is the predominance of the *Gramineæ*. On this account the flora is monotonous and uninteresting to botanists; but it is this very predominance of the social plants which makes these vast plains so valuable to the cattle-grazer. It is grass, grass, grass, everywhere! Even the poorest parts are not without some vegetation capable of furnishing pasturage. It is this fact, coupled with the mild climate—mild even in winter—which makes it possible to stock these natural pastures so heavily.

HARD AND SOFT GRASSES.

This perennial pasturage consists of two distinct classes of grasses. One of them has received the general name of "hard grasses" (*pasto duro*), and the other that of "soft grasses" (*pasto blando*). The first kind produces up to the period of its flowering an excellent nourishment for animals—better on account of its length and hardness for cattle and horses than for sheep. It dries after flowering, and then its leaves become as hard as straw and lose the greater part of their nutritive qualities. Nevertheless animals can still subsist on it in this state for several months, and in an emergency it will ordinarily carry them through the winter. The soft grass is composed principally of *Gramineæ*, more or less tender and savory, and which the natives of the country call under the name of *gramillas*; but it also includes some herbaceous species of *trebol*, and I may mention two species of *Erodium*.

10 feet in such dense array as to be impenetrable except in the cattle track. These beds of thistle sometimes extend leagues and leagues, and at the time of flowering, as far as the eye can reach, present an almost unbroken sea of rose-purple flowers. In some districts a day's ride along a road or track on either side of which stretches this forest of thistles, leaves the traveler still with the same forest stretching to the horizon. Thousands of cattle browse on these thistles, working tracks in various directions through them, feeding on them and the grasses which grow between. About midsummer they seed, wither, and die, a heavy rain and a stiff breeze quickly knocking down the stalks, while the softer stems soon break up under the action of the sun, the cattle and sheep growing fat as they feed on the oily seed and withering leaves. Other grasses, distinct in variety, then spring up and cover the ground, obliterating almost every trace of the fallen thistles. But in the autumn and winter the thistle seed again germinates, and the tender plants furnish a winter food for the cattle and sheep. But if the rains should happen to fail and a drought ensues (a misfortune which not unfrequently occurs), the soil becomes completely bare, and then the animals are reduced to eating such dry remains of these various grasses and annual plants as they can find. There are broad districts, particularly in the southern portions of the province of Buenos Ayres, which every summer are so entirely stripped of vegetation that the animals die of starvation, unless they are transferred to other points where the pampa has had the benefit of summer rains.

MIXTURE OF THE DIFFERENT CLASSES.

In the virgin fields of the pampa the hard and soft grasses are generally mixed, and by constant grazing the former are gradually exterminated. Thus throughout the sheep-ranges of this part of the province of Buenos Ayres only the soft grasses are now to be found, the pasturage having become thus refined by long use. In the outside country, which is more particularly devoted to the raising of horned cattle, the hard grasses predominate, the soft grasses only being found there growing between the isolated tufts of hard grasses. This is especially the case with the *alfilerillo*, a very succulent grass, which is only seen between the tufts, and which, spreading everywhere throughout the pampas, always springs up fresh, in all seasons, after a rain. This is also the case to some extent with the *trebol* or clover (spotted medic), which, from its luxuriant trailing growth and the great abundance of its seed, protected by prickly spiral pods, propagates itself very readily wherever it is aided by tufts of grass. It has, however, this disadvantage, that the seed-pods are a species of small bur (*caratella*), which sticks to the wool of the sheep and diminishes its value. In a day's ride over the pampas you will see all these various classes of hard and soft grasses growing up more or less together or alternating according to the nature of the soil, the hard grasses being more generally seen in the more elevated and the soft grasses in the more depressed portions of the country.

times called the "black" *cardo*. When young, cattle will eat it, but when it has matured its seed it is full of sharp nettles, which make a passage through it quite a disagreeable undertaking even for cattle. In the absence of timber the "camp-men" gather it in large quantities for fire-wood in winter. It is also used for burning brick.

THE PAMPA GRASS.

There are other tracts of country which, lying very low and wet, produce a coarse, reedy herbage, composed principally of species of *Dypa*, *Phalaris*, *Carex*, and pampa grass, which affords but little if anything in the way of nourishment; but growing very tall and spreading, furnishes shelter for whole herds of deer and a cover for partridges and martinets, while in the marshy grounds and lakes (*lagunas*), among these reeds, are to be seen myriads of wild ducks, plovers, cranes, spoonbills, flamingoes, geese, swans, and snipe in the season. These long reeds are used for thatching roofs, partition fences, and basket-making. But the pampa grass (*Gynerium argenteum*) is well deserving of special mention. I know nothing among our home flora which compares with it. The pampa grass is a perennial, whose special habitat is the Andes, among the cordilleras of which it is found even 14,000 feet above the sea-level. It seems, however, to grow anywhere throughout the pampas. It is a most showy plant, growing in immense tufts, and when in blossom appearing like white sheets hung on poles, and can be seen at a distance of many miles. The leaves are hard, wiry, very rough at the edges, scarcely half an inch broad at the widest part, of a dull gray-green color, and edged all along by sharp teeth, which if pressed will cut like "a two-edged sword." The flowers, which appear in March and April on panicles, shoot up to a height of from 3 to 4 feet. They are of silvery whiteness, and are densely covered with long colorless hairs. The dimensions of one of the clumps (for they grow in clumps) are about as follows: Height of the stalk to the summit of the plume flowers, 11 feet; height to the curl of the leaves, 7 feet; diameter of the tussock, 9 feet; length of one of the leaves, 9 feet; length of flower-plumes, 4 feet; number of flower-plumes to a clump, from 15 to 20. Such is the magnitude of this queen of the grass family. Its elegance is more noteworthy than even its size—every one of its long, thong-like leaves curling gracefully from the center to the circumference, forming a thin but huge tuft that defies the pencil of the artist to do justice to it. Add to this the glittering whiteness of the panicles, which dart into the air on their slender stems far above the verdant tuft of the foliage, and shake their thousands of bright scales in the sunshine like the work of some ogre silversmith. As an ornament to a well-composed scene of rock and shrub nothing can equal it. With proper room and supported by fine masses of shrub its beauty is superb. I have been thus particular in the description in order that you may see how entirely fitted this plant is for garden decoration on account of its majestic outlines and flower-plumes. It arrives at greatest perfection in a cool *side sedge*, and can at all times

PAMPA GRASS (*Gynerium argenteum*).

BURNING OF THE "CAMPS."

The tracts of land covered by these tall sedgy grasses are called *pa-jonales*, and when they do not lie too low they can be converted into excellent pasture by burning. This is generally done in the winter when the grasses have the sap out of them. These fires travel with the course of the wind, and, with the flames rising to a considerable height and careering in the darkness, they produce a singular effect in the night-time, uncovering, as they do, thousands of wild birds and animals which make their habitations in these jungles. Sometimes it takes several years of burning to redeem these lands, but ultimately the soft grasses will begin to show themselves. These fires readily burn them-selves out, and it is not often that any damage is the result. "Camps" with coarse grasses are sometimes fired and refired in the same way.*

Sometimes, however, by the dropping of a lighted match or the care-less disposition of the end of a cigar, a fire is started among the great thistle beds, the dry stems of which, in the summer-time, are like so much tinder or touch-wood, and then, unless it is promptly smothered, the losses are frequently very great. The dry thistles, intersecting each other and matted with the long dry grass and trefoil, extending over leagues of the pampa heated by the sun, are ripe for conflagration. If there is a breeze, the moment the grass ignites the blaze spreads right and left, and sweeping onward with a tremendous roar, it soon gains such breadth and such headway that it becomes almost irresistible in its course. Cattle, horses, and sheep fly terrified before it, the frightened herdsmen and shepherds galloping through the smoke, being sometimes utterly powerless to prevent them from being enveloped in the flames. The fire is finally subdued, if indeed it is suppressed before it runs its course, by the "camp-men" killing a number of horses, and then hitching two horses to their forelegs and two to their hind legs by means of "lassos," thus dragging the carcasses ahead of the track of the oncoming flames, in this manner clearing away the dried vegetation and leaving a space over which the flames do not pass.

SALINE PLANTS.

On towards the south of the province of Buenos Ayres, and especially when you enter the confines of Patagonia, both the soil and the vegetation become more and more salty. Saline efflorescences are found scattered over the whole of the province, and after a season of dry weather they become quite conspicuous; but real beds of common salt, more or less fine, appear to the far south and west. But little chance is there for sweet grasses where these exist, but on the edges of these deposits is found a vegetation of salt plants, of which the jume (*salicornia*) is the most common. It has no nutriment for animals, but its alkaline properties are most remarkable, containing as it does about 60 per cent. of soda and potash. Of all known plants the jume gives the greatest amount of ashes. This abundant distribution of salt gives an advantage over those of the north, as the

towards the Andes, giving them a great altitude of many thousand feet before they reach the foot-hills, but the surface is also slightly undulating. At first sight the elevations and depressions are scarcely remarked, but they are soon recognized by the difference of vegetation. These undulations are of the greatest practical importance to the *estanciero*, since at the bottom of each one of these depressions small lakes (*lagunas*) are found, which provide the necessary water for flocks and herds which feed around them; and when these fail it can nearly always be procured by sinking shallow wells. From these the water is generally brought to the surface by means of buckets made of raw-hide, suspended by tackle over a wheel and operated by horses, though of late American windmills to do the same work, by means of pumps, can be seen in all directions over the "camp." It is in these valleys especially that the tenderest herbage, mixed with flowers, is found. To this thick, grassy sward some other plants of different families are added, constituting a varied vegetation, whether it be composed of creepers with pulpos leaves, or of herbs, like the purslain, which form an appetizing nourishment for both man and beast. And then, charming the sight by the rich adornment and brilliant colors of their beautiful flowers, there will also be found the succulent *Portulacaceæ*, the vervains with their blood-red petals, the family *Compositæ* with their rich yellow blooms, and the papilionaceous plants, whose flowers look like butterflies fluttering in the sunshine. But nowhere is found that dense, compact, and magnificent sod which adds such a beauty to the pastures of blue-grass in the United States. The grass here rather grows in tufts, covering the soil like thousands of little islands, though at a little distance these grasses have the appearance of a compact sward, and are of a varied color, according to the season—bluish and clear green when the leaves begin to grow; a little later, brownish green, the color of the full-grown plant; and finally white as silver when the seeds ripen, and looking almost liquid at a distance as they undulate in the breeze. But when the midsummer or autumn has come, with a scorching sun and a want of rain, the aspect of the country undergoes a complete change. Then all is parched and brown. The thistle and the trefoil have disappeared, and the hard grasses have become dry and yellow. With a few summer showers, however, another growth of grasses will show itself under the shelter of the withered tufts, and the animals will be in no want of food.

POISONOUS WEEDS.

It must not be supposed, however, that the pampas are without pernicious weeds mingled with the nutritious pasturage which they afford. There are poisonous plants as well, and in some districts the extent of land occupied by them is so great as to be beyond the ability of the *estancieros* to effect their eradication. Perhaps the worst of these is the *miomio*, or *romorillo*, which hungered stock will sometimes feed on, and which is a deadly poison. There are others not so poisonous, but almost as dangerous, whose botanical names I do not know, but which are called by the natives *abrojo*, *sepo caballo*, *biznaga*, &c., and which, where they exist in great quantities, render sheep farming utterly impossible, and only admit of cattle-grazing.

is dying and the thorns are dropping off, and then the seed pods attach themselves, like those of the *abrojo*, thus quite ruining the fleece. But the districts where these and like pests of the sheep-farmer abound are exceedingly limited compared with the wide stretches of nutritious pasture which everywhere are to be seen.

DROUGHTS AND STORMS.

With the wealth of pasturage, indeed, which exists in the Argentine Republic, and especially the provinces of Buenos Ayres, Santa Fé, Entre Rios, and Corrientes, it would seem that there could scarcely be a limit to the production of cattle and sheep. With the most ordinary attention this would probably be the case, but the *estancieros*, as I have already said, seldom spend a dollar for the maintenance, not to say comfort, of their flocks and herds. The wide pampa is spread out before them. They have the range of the broad leagues which each *estanciero* possesses, and from the time they are dropped until death overtakes them they are left to shift for themselves.* During the spring and fall months, as we have seen, with an abundance of luxuriant grasses and succulent herbs on every side, they require but little oversight, but when the long droughts of summer come on and the second growth of grass does not appear, then, with streams and lakes dried up and no wells provided, immense losses are sustained. Cattle die by thousands and others stray away, sometimes to great distances, in search of food and water. In districts visited by drought to an unusual degree, sheep-farmers sometimes drive their sheep to other parts of the country, many leagues away, in order to save their flocks from starvation. And in the winter the situation is sometimes even worse. It is not unfrequently the case that the piercing southwest winds off the frozen Cordilleras will blow for weeks, bringing rain and sleet and snow, causing thousands upon thousands of animals to perish from exposure and hunger. Hurrying before one of these storms, I have known whole droves of cattle at last stopped in their mad career by some wire fence, and then dying piled up in masses upon each other. These losses, in the course of the year, amount to millions upon millions of both cattle and sheep.* And the natives call it *epedemia*, but epidemic has nothing whatever to do with it;† it is starvation and want of shelter. It is calculated that an acre of pasturage is required to properly feed one bullock or three sheep. But when you stock an *estancia* at the rate of three or four bullocks or six or seven sheep to the acre it must be an unusually good season for grass, with an unusually mild winter added in, if the animals manage to survive. It is this general tendency to overstocking which is the efficient cause of the dreadful mortality which yearly takes place among the cattle and sheep of the province of Buenos Ayres.

We are compelled to manage things better than this in the United States; and the result is that, no matter how protracted the droughts may be in summer or how severe the storms may be in winter, no such mortality among dumb cattle is ever known. We make provision for contingencies. We make use of pasturage and harvest and

30,000,000 acres."* Here in the Argentine Republic some hay (alfalfa) is grown, but it is for special purposes. It is sold in the cities or is baled and shipped to Rio Janeiro. It can be grown here nearly all the year round, and five or six crops may be taken during the warm months from the same field. Its growth is something marvelous, from 6 to 7 tons of excellent hay being cut from a single acre. But there is hardly an *estanciero* who has an acre of it in cultivation. Planting and harvesting hay is too much like work; and so his flocks and herds have to take their chances without it. The *estanciero* not only makes no provision for winter feeding, but he does not even exhibit the humanity or oversight of planting a belt of timber to the windward of his stock in order to break the force of occasional storms, and thus give a shelter to his animals.

THE VALUE OF THESE ARGENTINE PASTURES.

But in spite of all these short-comings of the cattle and sheep farmer, in spite of drought and storms, in spite of the fearful losses which these annually entail, the pasturage of the pampas, in the vast number of animals which it feeds and fattens, year in and year out, is an enduring source of wealth to the Argentine Republic. It is part and parcel of the assured riches of the country. It is the source and support of a greater pastoral industry than perhaps any other nation in the world possesses, and has been the means, in a little over thirty years, of bringing the Argentine Republic in the matter of sheep and cattle products to the first rank of producing countries. No one can gallop, as I have done, over this illimitable sea of succulent grass, everywhere so beautifully interspersed with an unending succession of scarlet and white verbenas, and blue nemophilas, and purple plantains, and floss-like panicles, and pearl-studded plumes, and black-spotted medic, and a thousand other flowers with their variegated sheets of color, all indiscriminately furnishing food for the millions of sheep and cattle and horses which browse upon them, without feeling that with such a wealth of vegetation offering itself spontaneously and without labor to the country, there need be no anxiety in regard to the future greatness of the Argentine Republic.

E. L. BAKER,
Consul.

CONSULATE OF THE UNITED STATES,
Buenos Ayres, March 26, 1887.

IRRIGATION IN AUSTRALIA.

REPORT OF CONSUL GRIFFIN.

The recent publication of a series of elaborate reports by the various colonial governments on the conservation of water, together with the arrival in Sydney of a number of American engineers and capitalists interested in the science of irrigation, has awakened very general interest in the subject throughout Australia. ever, as far as the

consists principally in pumping the water out of the rivers onto the land. American pumping appliances are usually employed, and are admitted by every one to be superior to all others.

MOUNTAIN SYSTEM OF AUSTRALIA.

It should be remembered, however, by those contemplating the inauguration of an extensive system of irrigation in Australia, that the conditions of the country here are altogether different from those in the United States. In the first place, unlike America, there are no large rivers and lofty mountains in Australia. Although the mountains in the latter country extend over a vast area, their average elevation is only about 3,000 feet. The highest peak in Australia, Mount Kosciusko (7,308 feet), is about 700 feet below perpetual snow.

The mountain system of Australia is described as a very simple one. It can, perhaps, be very well understood by a brief reference to the various ranges in the colony of New South Wales. The system is usually distinguished by four main ranges, viz, (1) the interior ranges, (2) the great dividing chains (3) the coast ranges, (4) the isolated peaks and groups.

The interior ranges approach the western boundary of the colony and form the western water-shed of the Darling River. The greatest elevation of the interior ranges is 2,000 feet.

The great dividing chain contains the highest peaks in Australia and runs throughout the whole of the island continent. It is subdivided into seven main branches and separates the eastern and western water-sheds of the colony.

The coast ranges are on the east side of the great dividing chain and form the edge of the high table-land. The highest peak of the coast ranges is Mount Coolungera, 3,712 feet.

The isolated peaks and groups contain a considerable number of mountains, but all of them are below 3,000 feet in height.

THE RIVERS.

With the exception of a few small streams, all the rivers of the colony have their origin in the main dividing chain. The principal rivers of the eastern water-shed are the Hawkesbury, the Hunter, and Clarence. The Hawkesbury is 330 miles in length, the Hunter 300 miles, and the Clarence 240 miles. All the rivers of the eastern water-shed flow into the Pacific Ocean, and are estimated to drain an area of about 50,000 square miles. The principal rivers of the western water-shed are the Darling and its affluents, the Lachlan and its affluents, the Murrumbidgee and its affluents, and the Murray and its affluents. These rivers all eventually unite with the Murray, which empties into Lake Alexandria, near Adelaide, South Australia.

The Darling River is 1,160 miles in length. It drains, with its affluents, an area of 198,000 square miles. It is, however, a narrow stream

small streamers. *waterly and*

untrustworthy for water supply. In most cases they are mere depressions connected with the rivers, and receive their water only in times of flood.

LAKES AND CANALS.

It is maintained in the report of the royal commission of New South Wales for the conservation of water that there are three lakes in the course of the river Darling, each of which has an area of 60 square miles, and that their capacity is shown by the fact that when rapid falls occur in the Darling the overflow from them keeps the river navigable for nearly a fortnight longer than it would be otherwise. This, the report says, is an important feature, as the outlets from the Darling are in their natural state, and that with few exceptions no attempt has been made either to increase or regulate the supply of water.

In the lakes east of the Darling, in the county of Livingstone, an almost permanent supply of water is kept through the construction of a dam across Tallawalka Creek. The cost of this, about \$20,000, was incurred by the lessees of the land. It is said that this dam threw the water into a series of lakes extending north and south a distance of 80 miles.

The report of the royal commission states that the levels of the country between the Murray and Murrumbidgee show that it is well adapted for the construction of canals. The country between the Lachlan and Murrumbidgee is more irregular, but the vast area lying between the Lachlan and the Darling, which appears as a blank on the maps of the colony, possesses some well-defined features. For instance, the waters of the Darling and Lachlan are ordinarily separated for about 200 miles, but in time of flood they spread out to within a distance of 25 or 30 miles of each other.

SCHEMES FOR IRRIGATION WORKS.

Mr. James Harold, of this city, who has had much experience in farming by irrigation in the United States, and to whom I am principally indebted for the material of this report, says that there is a great clamor throughout the colony for a grand national scheme of irrigation by those who have no knowledge whatever of the cost of such an enterprise, or from what source the water is expected to be obtained. The truth is, Australia has no lofty snow-capped mountains from which to draw supplies, and therefore the rivers and streams very naturally become dry at a time when water is most needed for irrigation purposes. Indeed during dry seasons the rivers amount to but little more than a chain of water-holes. The land-owners on both sides of the Groydir River, an affluent of the Darling, are all clamoring for the right to dam the river without even a thought of the injury it may do to others. Mr. Harold says that they do not seem to know that the lucky individual at the source of the river would get all the water and that the less fortunate one lower down the stream would not get any. It has been proposed by graziers to place weirs or obstructions in the rivers for the purpose of turning their flood-waters into the numerous blind creeks and depressions which are found in various places upon the plains. Mr. Harold, however, objects

account of the recent heavy fall of rain, the blind creeks and depressions along the plains are filled with water, but such water cannot very well be impounded. If numerous weirs were placed in these streams the water would soon cease to flow.

EVAPORATION.

There are numerous depressions on the western plains, from 8 to 10 feet deep. Many of these are partly formed by their banks being raised above the level of the surrounding plains, and if they could be kept full of water much of it could doubtless be drawn off by gravitation for irrigation purposes. These lakes, or depressions, so long as they contain water may be of great advantage to the farmer, but in time of drought they are dried up, and therefore cannot be depended upon. Mr. Harold says that the evaporation from these lakes will amount to about 10 or 12 inches per month, and that the thought of obtaining a permanent supply of water from them is altogether out of the question. In the report of the royal commission it is stated that various opinions exist among farmers and graziers as to the extent of the evaporation of these lakes; that some contend that it is as much as a foot per month for three or four months, while others say that it will not amount to more than 3 feet per year.

The assistant engineer for roads, who is charged with the construction of tanks, says that from a tank containing 18 feet of water evaporation would not exceed 4 or 5 feet per year. It was stated at the inquiry of the royal commission that in the Groydir district 2,000 sheep were watered for more than a year from a tank 10 feet deep, and there was water in it then, although none had run into it the whole time.

One witness stated that the average depth of a swamp into which water has flowed from the Bulla River was fully 4 feet, and that the water lasted fifteen months before it disappeared from evaporation and soakage.

The conditions upon which observations are made differ materially. For instance, the report of the royal commission states that the hot winds, which are of comparatively rare occurrence in the coast district, and which range in temperature at Sydney from 80° to 106° Fahrenheit, are more frequent on the western plains, where the thermometer sometimes records 130°, and for days stands at 110° to 116°. It would be a mistake, however, to attribute this condition of wind to long periods, for the wind records show that as compared with the coast districts the country beyond the main dividing range has a comparatively tranquil atmosphere.

The subjoined table was furnished the commission by Mr. Russell, the government astronomer:

Result of observations with the tank evaporation.

Month.	Bourke.	Hay.	Hillston.
	Inches.	Inches.	Inches.

A series of experiments have recently been made by Mr. Russell for the purpose of testing the evaporation power of some of the larger lakes of the colony. In 1885 he placed a self-registering evaporation gauge in Lake George. This lake is about 19 miles in length and 6 in width. It is situated on the eastern side of the great dividing chain at an elevation of 2,200 feet above the level of the sea. Its waters, however, have no outlet, and consequently are strongly impregnated with salts. Lake George has never been known to overflow, and in dry weather it has failed entirely. The following table shows the results of Mr. Russell's experiments:

The water-gauge in Lake George.

Date.	Evaporation.		Rainfall.	Total loss by evaporation.	
	Reading of gauge.	Loss or gain.		Amount.	Months.
1885.	<i>Inches.</i>	<i>Inches.</i>	<i>Inches.</i>	<i>Inches.</i>	
March 1	2.8				March.
April 1	6.8	-4.0	0.44	4.44	April.
May 1	7.7	-0.9	1.54	2.44	May (very windy).
June 1	8.8	-1.1	1.92	5.03	June.
July 1	6.7	+2.1	3.42	1.32	July.
August 1	5.0	+1.7	1.82	0.12	August.
September 1	5.4	-0.4	1.06	1.46	September.
October 1	7.9	-2.5	1.15	3.65	October.
October 31	10.7	-2.8	1.74	4.54	
Total		-7.9	13.09	20.99	

In a note accompanying this table Mr. Russell states that he added only the rain which fell on the lake and not that which flowed into it, taking the mean of two rain-gauges, one at each end. He says further that during the last 14 years the lake has lost by evaporation 12 feet.

ARTESIAN AND OTHER WELLS.

The royal commission in reporting upon wells is unable to express an opinion as to the theory of an underground flow of water in Australia to the ocean. They mention that water has been found at Tarkania in South Australia, 150 miles from the western boundary of New South Wales, in latitude 29°, at a depth of 1,220 feet, or 1,040 feet below sea-level. The water rose 20 feet above the surface. Water was struck at Hergott Springs, also in the same colony, at 339 feet. The flow at Tarkania is only about 40 gallons per day, but the well at Hergott Springs yields 5,000 gallons per day. The diameter of the bore at Tarkania is 3 inches, and that at Hergott Springs is 6 inches.

A supply of fresh water was obtained at Bowrke, New South Wales, at a depth of 480 feet, and at another station near there at 550 feet.

The most important discovery of water in Australia, according to a recent report of Mr. H. I. Slee, superintendent of diamond drills for this colony, occurred during the present year at Wanaaring, Bowrke district, at a depth of 942 feet from the surface. The water was tapped on the 18th of February at 3 p. m., when it rose in tubes and flowed a steady stream, and has increased steadily in volume. Mr. Slee is of opinion that this

results from the present boring operations on the road from Bourke to Wanaaring. If artesian water was tapped all along this road, which I believed would be the case, these boring operations would be successfully extended in the cretaceous basin to Wanaaring, Milparinka, and Mount Browne. In some parts the bores may have to be put down from 700 to 800 feet; in other parts from 400 to 600 feet might be probable depths. The greatest drawback in that remote part of New South Wales is the great scarcity of water, and if this was once overcome by artesian wells, all the stock and wool now finding its way from Cooper's Creek, Thargomindah, Mount Browne, and Mount Poole districts would be directed toward the Bourke Railway station and credit is due to Foreman Carmichael, who has rendered me every possible assistance, and who has had many hardships to undergo while boring operations were going on. From personal inspection, and from my knowledge of the country, I expect further favorable results, both of the 18 and 93 mile bores.

To this report the under secretary for mines, Mr. Harrie Wood, attached the following encouraging minute:

This is the deepest bore ever sunk in New South Wales by means of a water-auger, and the greatest credit is due to the superintendent and foreman for the manner in which they have conducted these works in the face of great difficulties.

The people in many districts have given up the practice of sinking for water from the fact that when found it is of a brackish nature, and depend principally upon tanks for the conservation of water. Of course the farmers have to wait for the wet season before their tanks can be filled. The tanks used are often too wide and shallow. In open tanks, from which the sheep take water freely, the loss is enormous through weak animals getting bogged. Tanks are less expensive than wells, but when the right kind of water cannot be found by ordinary sinking, the artesian well should be the farmers' main dependence. In some districts it has been noticed that in almost every case where water has been struck, salt water is invariably found at higher levels and not unfrequently near the surface. In these circumstances the presence of salt water should not discourage those from undertaking deeper explorations.

The colonial geologist accounts for the prevalence of salt water in the alluvial districts from the fact of its fresh-water origin. The debris washed from the ranges has been deposited quickly and the decomposition from the mineral constituents arising from the moisture has converted the fresh water into salt. Sulphate of alumina, lime, and magnesia have been formed, and salts chemically produced. In the marine formations the soluble parts of the mineral have been washed out by the long continued action of the sea water. When the water flows underground it is fresh, but whenever it is stationary, as it may be in clay beds a few yards from the current, it will become salt. The saline nature of the soil has given rise to well-marked peculiarities in the herbage, such as the salt bush.

Some good work in artesian boring has been done by private enterprise, but the great part of the work is left to the government. Mr. Harold, in reply to some interrogatories of mine on the subject of well-boring, says that the Australians need more than anything else a few good sets of the ordinary Pennsylvania oil-boring apparatus or applied into the hands of men who know

where dikes of mineral-bearing rock occur. The most remarkable artesian belt in Australia occurs in the Liverpool Plains, in the northern part of New South Wales, but very little has been done to develop it. In the early history of the country water was very scarce in that district. All the rivers and creeks in the summer were turned into sand tracks. Wells were sunk there, and the water has continued to flow from them ever since. The greater part of the district is what may be called good boring country, and little trouble need be apprehended from the swelling of the surfaces of the bores, as little soapstone is met with.

THE RAINFALL.

So much is said about the drought of Australia that very few persons are aware that the average rainfall in all the colonies will compare favorably with that of other countries. In New South Wales, a territory of 310,000 square miles, the average rainfall is 24 inches. At Sydney it is about 50 inches, at Eden it is 70 inches, but in the flat country it is only about 10 inches. The average rainfall in Queensland is about the same as that of New South Wales. The former colony, however, is more subject to tropical rains than the latter. The rainfall, therefore, in Queensland rises in some districts, as for instance Johnstone River, to 123 inches; in other places the average is as low as 8 inches.

At Adelaide, South Australia, where there are no high coast ranges to arrest the drift of the clouds, the rainfall is as low as 20 inches. At Port Augusta it falls to 8 inches. At Perth, Western Australia, the average is 31 inches, but at Canaroon, in the same colony, it does not average more than 6 inches. At Eucla it is 10 inches. The rainfall in Victoria varies from 63 inches at Cape Schanck to 12 inches at Wycheproof. At Melbourne it is about 25 inches.

The trouble, however, in Australia is that whenever there is a diminished rainfall the effects are much more disastrous than in other places on account of the great heat of the sun and the absence of more general cultivation. A diminished rainfall of 50 per cent. has at times desolated vast tracts of country. The report of the New South Wales royal commission, however, states that while one part of the country suffers from a diminished rainfall other parts have an average supply and others again may be favored with an abundant fall. In the basin of the Darling, excluding the hilly portion, the rainfall is 12.81 inches. In the plains between the Lachlan and the Murrumbidgee it is 16.33 inches, and in the corresponding district between the Murrumbidgee and the Murray it is 14.56. These rainfalls would be sufficient for ordinary crops of cereals if they came at proper periods, but the report of the commission admits that they do not. It says that as a rule in these districts when rain is most needed it comes in such small quantities as to be of little or no benefit to vegetation.

STORAGE OF WATER.

One of the most difficult questions with which Australians have to deal in connection with the subject of irrigation is the best way of storing water. There is no doubt that a temporary storage of water is necessary in some districts.

hours. The report of the New South Wales royal commission recommends the establishment of large reservoirs at the heads of the principal rivers and creeks and the placing of movable weirs across others in time of flood. They also recommend the establishment of sluice-gates to prevent the return of water to the main stream. Mr. Harold, in commenting upon the report of the commission, says that whatever is done for irrigation should be done by huge artificial water conservations in the mountains and by artesian and other wells. He says occasionally, in times of floods, water might be preserved, but it could not be depended upon. In conclusion he says that we should bear in mind that very fair crops can be grown over a large area in New South Wales without the aid of irrigation. He cites in support of this statement the fact that during the drought of 1886, one of the severest ever known, the average yield of wheat in these districts was $10\frac{1}{2}$ bushels per acre. Mr. Harold says, however, that it is useless to think of irrigation for pastoral purposes in Australia, except upon a limited scale, as the cost would be too great. "It might answer," he says, "where land can be had at almost nothing, but where population increases the land will become more valuable, and it will be required to grow food for the people instead of grass for sheep."

RIPARIAN RIGHTS.

The New South Wales commission is very decided in the opinion that the riparian rights which exist under the common law of England are not at all applicable to the conditions of Australia, and that an attempt to enforce them would be a serious disturbance to the progress of the country in so far as that progress depends on the conservation of water. In the colony of Victoria no such rights can accrue, from the fact that the frontages to all rivers are reserved from sale. The conditions in New South Wales and other colonies are altogether different. Extensive alienations have taken place, which involve the legal rights of ownership to the middle of the beds of streams.

A memorandum as to what riparian rights really mean under the common law was prepared for the information of the commission by Mr. Alexander Oliver. In this memorandum Mr. Oliver quotes largely from Mr. Justice Story's opinion in the case of *Tyler v. Wilkinson* (4 Mason, U. S. Reports, 397), where it is laid down—

That *prima facie* (i. e., the law presumes) every proprietor upon each bank of a river is entitled to the land covered with water in front of the bank to the middle, the bed of the stream, or, as it is commonly expressed, *ad medium filium aquæ*. In virtue of his ownership he has a right to the use of the water flowing over it in its natural current without diminution or obstruction. Mr. Justice Story says that the consequence of this principle is that no proprietor has the right to use the water to the prejudice of another, and that it is wholly immaterial whether the party be a proprietor above or below in the course of the river, the right being common to all the proprietors; therefore no one has the right to diminish the quantity which will, according to the natural current, flow to the proprietor below or to throw it back upon the proprietor above.

Mr. Oliver's memorandum the commission states that the common law, are better

of a flowing stream or who make such a diversion of the water as would inundate his land.

The commission states:

The position with which we have to deal is not so much with flowing water as with dry channels through which water flows only at long and irregular intervals. It is required that these water-courses should be made to hold water—to be in effect converted into inundation canals; but this would not be possible under the present state of the law, by which any litigious person could, if so minded, interpose a bar to the erection of weirs or other works.

The commission further states that there should be no difficulty in superseding the presumption of the English common law by a clear enactment of state ownership, for the common law only gives a riparian owner power to use so much of the water of a river as he requires for his own consumption and that of his own stock, while the object and effect of state ownership would be to increase the supply of water, which now often wholly fails, and to make it permanent.

GOVERNMENT AID TO IRRIGATION.

Several of the Australian governments have entered into agreements for the transfer of extensive tracts of land to various irrigation companies.

The South Australian government has recently perfected arrangements with the Messrs. Chaffey Brothers, who have considerable experience with irrigation in California, by which the firm may acquire 250,000 acres of land in that colony. The firm is to have 30,000 acres at once upon the condition that it will during the first five years spend the sum of \$175,000, during the second five years \$700,000, during the third five years \$375,000, and during the fourth five years \$250,000, or a total of \$1,500,000. On spending \$5 per acre on the land, inclusive of the first 30,000 acres, the irrigationists may acquire the fee-simple up to 50,000 acres. This will leave 200,000 acres. When the Messrs. Chaffey have expended \$5 per acre upon this area they may purchase it for another \$5 per acre, so that altogether it will cost them \$3,000,000 to gain the fee-simple of the whole block of 250,000 acres. It is further agreed that all the machinery and pipes shall be manufactured in the colony, unless the government should determine to send abroad for them.

The government of Victoria has also concluded an agreement with the same firm, by which the Messrs. Chaffey Brothers are to have 50,000 acres in what is known as the Malley country, on the Lower Murray frontage, 11 miles east from the junction of the Darling, with the right of purchasing 200,000 acres hereafter. The fee-simple of the land was valued by the surveyor-general at 60 cents to \$1.21 per acre, but the highest rental ever offered for it was 2 cents for every 14 acres.

The Messrs. Chaffey undertake in this agreement to expend the sum of \$1,500,000 within twenty years upon 47,000 acres in constructing irrigation works and for building an agricultural college. The land when cleared for settlement is to be cut up in small blocks of not more than 80 acres, if planted and prepared for fruit-growing, and not more than 160 acres if for other products, each to be for one person to be allowed to

PETROLEUM FUEL.

be spent in improvement upon 235,000 acres of Malley land, and the sum of \$2,100,000 paid to the government.

This agreement met with vehement opposition in the colonial parliament, but after a series of protracted debates it was finally agreed that the Messrs. Chaffey Brothers should enter upon the occupation of their land.

G. W. GRIFFIN,
Consul.

UNITED STATES CONSULATE,
Sydney, New South Wales, March 8, 1887.

PETROLEUM FUEL.

REPORT OF CONSULAR AGENT CHAMBERS, OF BATOUM.

In January there appeared in the Baku News (*Bakinskia Izvaistia*) a communication from Mr. F. V. Urquhart, a gentleman intimately connected with the Russian railways contiguous to the Volga, in which he gives the most complete, comprehensive, and accurate comparison of the results from coal and petroleum residuum fuel for locomotives that I have ever seen. It is not the result of a single experience, but of a year's use of each article, with the figures, in detail, upon which he bases his conclusions. That Mr. Urquhart is probably the most competent authority upon the subject in Russia (and, of course, the world, as nowhere else have the merits of petroleum fuel been so thoroughly tested) cannot be doubted, and that his system for burning petroleum residuum is the best, is, I think, conclusively proven by its almost universal adoption by the railways using that kind of fuel. The following is an abbreviated translation of Mr. Urquhart's communication, with the statistics given by him:

I deem it my duty to say that, thanks to your communications in 1883, regarding the great success in the use of petroleum residuum fuel in the locomotives of the Griazi-Tsaritzin Railway and the railways contiguous to the Volga River and the Caspian Sea, ordered special technical agents to familiarize themselves with the system of burning residuum, which, having overcome all technical difficulties (which up to that time had been the great obstacle in the way of the general use of this new fuel for steam engines), it can be said, had laid the foundation for its systematic use. After the Griazi-Tsaritzin Railway, the Tamboff-Saratoff Railway was the first to use my system of burning residuum, and the others soon followed, including the Trans-Caucasian and Trans-Caspian, by first adapting several locomotives to its use, in order to test it in comparison with other methods.

Four years have passed since the Griazi-Tsaritzin Railway began to use petroleum residuum fuel, and I take the liberty to communicate some of the results of my system as used upon the locomotives of that railway, which is the only one in the world using for all its locomotives (143) and stationary boilers (50) petroleum residuum fuel only; in fact, I can say without exaggeration that for making steam and in the shops of the company no other fuel is used.

The first conclusively successful trip of a locomotive using petroleum residuum fuel was made in January, 1883, and was closely followed in the spring of the new fuel. By October 1, 1884, the result of

Expenditure of coal in 1882 and petroleum residuum in 1885, inclusive of kindling-wood, on eight-wheel engines at the head of the train, and also those of the reserve one and two engines, for one engine-verst.

100 rubles coal=57.65 rubles petroleum.

Griazi-Tsar.

Cost of moving 1,000 car axles per verst, 1881, 5.91 rubles; 1882, 5.51 rubles; 1883, 5.37 rubles; 1884, 3.70 rubles; 1885, 3.15 rubles. With coal in 1882, 5.91 rubles, and with petroleum residuum in 1885, 3.15 rubles, or a saving of 46.7 per cent.

In conclusion, I take the liberty to say, that owing to the circulation given to the first information regarding my improved system of petroleum burning, technical agents from North America and Italy were sent to Borisoglebsk to study it, and at present it is in use in America, Burmah, India, Italy, and several other countries, and even for torpedoes.*

I think Mr. Urquhart proves intelligently and conclusively the great advantage of petroleum fuel over coal in the localities where coal is expensive and a sufficient and cheap supply of residuum is obtainable, but the price he quotes for coal (21.17 copecks, per pood, not less than \$6.70 per ton at that time) is exceedingly high, and cannot, of course, be taken to compare the actual values of the two articles outside of Russia. He also shows, equally as conclusively, the difference in the two articles of fuel (coal, 100; residuum, 56.3) to be much smaller than has heretofore been shown by the enthusiasts for the "fuel of the future."

That there is a doubt in the minds of those most competent to judge even in Russia as to the permanency of the present advantage of petroleum fuel over coal, even for use in the countries nearest the base of petroleum supply, will be seen by an extract from a speech delivered May 19 (31), before the Baku Technological Society, by Professor Mendelaef, a leading Russian scientist sent by the Russian Government to Baku last year to study the petroleum industry, and who is unquestionably an enthusiast regarding that industry. This gentleman, in the course of the speech alluded to, said:

The sale for petroleum residuum is definite; it will have the same sale in the future; but the country cannot base its manufactures on petroleum fuel, which is unknown and unguaranteed, while coal is known and guaranteed. At the present moment residuum is overthrowing coal, because of a lack of adequate transportation facilities from the Don coal-fields to the Volga country, from whence it would thrust itself to the manufacturing centers—the governments of Vladimir and Moscow. However, in the order of the decision of the question of constructing the Eastern Don Railway, the coal will prevail. In the interest of the fuel supply of the Empire it would be safer to increase it with coal. Killing the coal on the Volga now, petroleum products will themselves be killed, and it is to be hoped that to such a demand for petroleum a limit will be put.

These facts and opinions, coming as they do from the two most eminently competent Russian authorities upon the subject, cannot be attributed to "American prejudice," as are generally the few plain truths told regarding the Russian petroleum industry which do not show that industry up in the rosiest hues.

The present limited transportation facilities from Baku to the Black Sea make thoughts of petroleum displacing coal for fuel, even upon steamers in the Black Sea trade, impossible. To-day English coal can be bought at Batoum, duty paid (the duty is about \$1.44 per ton) for \$6.50 per ton, while a supply of residuum can only be had by shipping it from Baku in barrels, at a cost of nearly twice the price of coal for freight only. Residuum, to displace coal in the Mediterranean trade, would have to be delivered at Constantinople and Malta, because if it were given away at Batoum it would hardly be sufficient inducement for vessels to spend the six or seven days necessary to run from Constantinople to Batoum for fuel. Taking the present and minimum cost of

* Owing to the fluctuations in the value of Russian...

PETROLEUM FUEL.

the article at Baku, 70 cents per ton free on board, the rate of freight in bulk from Baku to Batoum, with the expense of pumping into tanks and vessels at \$4.95 per ton (which is also the minimum, admitting the railway capacity to be unlimited, which it never can be), and the sea freight the same as is charged by steamers to Odessa (a shorter run), \$2.80 per ton, the actual cost of residuum at Constantinople will be \$8.45 per ton, to which not less than 10 per cent. must be added for profit and expenses there, and we have \$9.30 as a fair selling price there, against English coal at \$5 and \$5.25 per ton. As Malta is five or six days farther than Constantinople, and English coal worth about \$4 or \$4.25 per ton there, delivering residuum there is wholly out of the question.

The great and only inducement held out to ship-owners to abandon the use of a known and tried fuel, the supply of which is assured, and to alter their steamers to burn a new fuel, the supply of which is exceedingly uncertain, and the expense of which, even under the most favorable circumstances that can at present exist, must be greater than coal, is that a pipe-line from Baku to Batoum will soon be constructed, refineries erected on the Black Sea coast, and residuum will be given away in sufficient quantities to supply the world.

PROPOSED PIPE-LINE.

In a former communication I alluded to the much talked of concession offered by the Russian Government for the construction of a pipe-line from Baku to the Black Sea. To show what is conceded it is unnecessary to quote the conditions of this concession entire, but simply to give the following extracts from them: First. All pipe, machinery, and material for the line must be manufactured in Russia and from Russian material. Second. The Government will exercise the most strict control of the line, to see that no one having an interest in it has any other direct or indirect interest in producing, refining, or trading in petroleum products, which is strictly forbidden. Third. The minimum charge for transportation from the wells to the Black Sea is about 39 cents per barrel of 42 gallons, a distance of 560 miles (against 45 cents per barrel charges in America for 300 miles); and last, the whole construction of the line is to become the property of the Government after seventy-five years, which means that none of the material can from time to time be removed for use elsewhere. There is also a small Government tax to be paid by the company owning the line, equal to the present value of the crude oil at the wells.

Is it at all strange that capitalists of a sufficiently philanthropic turn of mind (excepting, of course, newspaper and prospectus writers) to accept this remarkable concession (?) seem very slow about coming forward?

Recently some of the enthusiastic advocates of a Baku-Batoum pipe-line, petroleum fuel, &c., have called attention to the railway now being constructed from what they term the "Black Sea petroleum field" to the Black Sea, as affording a future outlet for petroleum fuel to the Black Sea, and the fact that a pipe-line from the

At present there are not more than half a dozen small steamers in the Black Sea using petroleum fuel; they run between Russian Black Sea ports, and have been getting their residuum at Novorossisk at a cost of about \$5.75 per ton (it cost the sellers fully ten times that amount). A small sailing vessel fitted to carry residuum in bulk from Novorossisk to Odessa took one cargo to Odessa, which from the fact that this vessel is now loading here, and will be more than thirty days getting a cargo of 300 tons, at a cost of probably not less than \$12 per ton here (sales were made of small quantities at that price, but not for fuel, last month), it is fair to presume that the supply at Novorossisk is either exhausted or that the product was not satisfactory. Another significant fact is that the Russian Steamship Company, the most energetic, enterprising, and best managed corporation of Russia, owning the greatest number of steamers in the Black Sea trade, has never seen fit to change from coal to petroleum fuel.

These are indisputable facts, and the inference is, I believe, only reasonable that if it is dependent upon the supply from Russia, petroleum is indeed a "fuel of the very distant future."

JAMES C. CHAMBERS,
Consular Agent.

UNITED STATES CONSULAR AGENCY,
Batoum, March 1, 1887.

TRADE OF GERMANY IN THE YEAR 1886.

REPORT OF CONSUL WAMER.

According to estimates made from the official figures of the quantities of the imports and exports, the value of the trade of Germany, including precious metals, in the year 1886, was as follows:

[1 ton=1,000 kilograms.]

Years.	Imports.		Exports.	
	Quantity.	Value.	Quantity.	Value.
1886.....	<i>Tons.</i> 16,940,488	\$703,510,864	<i>Tons.</i> 18,924,284	\$740,638,864
1885.....	17,867,330	711,612,622	18,840,023	693,831,166
	-926,842	-8,101,758	+84,260	+46,807,698

The imports, as compared with those of the year 1885, show a decrease, while the exports have increased. In the year 1885 the balance of trade against Germany was to the extent of \$17,781,000; in 1886 the balance in her favor was \$37,128,000. In the first half of the year 1886 the crisis continued to make itself felt, which did not
signs of improvement until
export

has declined from \$73,542,000 to \$51,170,000. This decline in the import of grain lies in the falling off in the consumption. The export of manufactured articles has in some respect considerably increased. For instance, the export of silk goods has risen from \$31,773,000 to \$38,913,000, woolen goods from \$37,842,000 to \$41,050,000, and hosiery from \$20,944,000 to \$24,752,000. The export of clothes, ready-made linen, and millinery goods amounted to \$20,658,000 in 1885, and \$23,216,900 in 1886; laces, embroideries, and silk laces rose from \$9,146,340 to \$14,113,400, and hardware and jewelry from \$19,232,750 to \$21,950,740 for the same periods. The import of machinery, instruments, and apparatus has decreased by \$2,284,000, and the export by \$654,500. Of cattle and other living animals the import has decreased by \$4,274,000, and the export by \$3,689,000. The export of sugar, sirups, and molasses has risen from 623,903 tons to 635,321 tons. Raw fat and grease materials show a decrease of import to the extent of \$1,438,520, and of export to the extent of \$150,000. The import of manufactured goods has declined by \$2,246,720, and the export by \$435,540. The value of the imports of pottery, earthenware, porcelain, and glassware exceeds the value of the exports.

These figures show a marked turn in favor of the trade of Germany for the year 1886, and the crisis of 1885, which threatened to continue in 1886, was thus overcome.

WM. D. WAMER,
Consul.

UNITED STATES CONSULATE,
Cologne, April 21, 1887.

THE PROJECT FOR UTILIZING THE RHINE FALL.

REPORT OF CONSUL CATLIN.

In this practical age of inventions and progress, where the telegraph pole and the factory chimney rear themselves against the horizons of every landscape; where mountain fastnesses and remote valleys, long consecrated to the charms of nature alone, now resound with the whistle of steam and the stroke of the hammer; and where the iconoclastic hand of enterprise, divested of all sentiment, is reaching out into every nook and corner of the universe to discover and develop new commercial opportunities and resources—in such an age it is not surprising that an application backed by large capital has recently been made for a concession to utilize for the manufacture of aluminium the water-power of the largest cataract in Europe, the falls of the Rhine at Schaffhausen, in this consular district.

Some 25 miles below the point where it issues from the Lake of Constance the Rhine, with a width of 350 and an average depth of about 100 fathoms, is varying in height from 45 feet on the rapids the

the mountains, and the rise in all the tributary streams and brooks, the Rhine reaches its highest point. The following table shows the Rhine's average depth and volume at Schaffhausen, in each month of the year, based on observations covering the period from 1852 to 1886:

Month.	Depth.	Volume per second.	Month.	Depth.	Volume per second.
	Meters.	Cubic meters.		Meters.	Cubic meters.
January.....	6.817	137	August.....	7.623	403
February.....	6.623	118	September.....	7.396	325
March.....	6.745	122	October.....	7.310	293
April.....	6.862	146	November.....	7.074	210
May.....	7.091	217	December.....	6.948	170
June.....	7.581	388			
July.....	7.892	502	Average.....	7.172	252

As showing how systematically and thoroughly observations of a similar nature, all of them tending to determine the Rhine's volume at Schaffhausen, have been carried on for years past, the following instances may be cited: Oberbaurath Honfell, in his publication entitled "*Der Bodensee* (Lake Constance) *und die Tieferlegung seiner Hochwasserstande*," states that between 1817 and 1876, a period of sixty years, the Lake of Constance and consequently the Rhine at Schaffhausen reached their lowest water stand, viz, 6.29 meters, in the year 1858. During the period of ten years following that above cited, *i. e.*, from 1876 to 1886, the lowest depth was 6.54 meters, and that occurred in 1882. Hence during the entire seventy years from 1817 to 1886, the lowest point reached was that of 1858, and that measurement may be and therefore is taken as the minimal one in determining the volume of water.

There is, however, a noticeable variation in the results obtained from calculations based on that measurement. One made by Herr Zuppinger, of Escher, Wyss & Co., of Zurich, on January 26, 1858, gave 54 cubic meters per second; another by Herr Ziegler, of Winterthur, March 24, 1858, 87.4 cubic meters per second; and a third by Messrs. C. Stauber & Co., of Zurich, during the same year, 81 cubic meters per second. Upon which of these the most dependence may be placed is uncertain, but it will not be much out of the way to say that the lowest volume of water recorded during seventy years past as passing over the Rhine Fall is not less than 70 cubic meters per second. The minimum for the last twenty years has been 164.5 cubic meters per second; the maximum for the last thirty-four years, as we have seen by the above table, has been 502 cubic meters per second.

OBJECTIONS TO THE PROPOSED WORKS.

It is upon these results that the application for the use of the water-power is based. The applicants, Messrs. J. G. Nehers, Sons & Co., iron workers at Schaffhausen, ask the privilege of constructing the Laufen mill to the water.

tion the necessary maps, plans, and drawings. They further announce that a stock company, with a capital of 12,000,000 francs, is prepared to conduct the enterprise, and they offer all reasonable guarantees against any marring or defacement of the natural beauties of the falls.

But now come the hotel kings, men of influence in Switzerland, and many others like them dependent upon the so-called "*Fremden Industrie*," or tourist business, and enter a vigorous protest against the granting of this or any other similar concession. From time immemorial, say they, the fame and beauty of this cataract and its surroundings have attracted to this section of Switzerland annually increasing throngs of strangers from all parts of Europe and America, who bring with them in the aggregate large sums of money, and impart an impetus to every branch of trade and travel.

Mar the charms of this great waterfall, diminish or destroy its attractiveness and what, argue they, will be the result? An immediate falling off in the tide of summer travel hitherward, a consequent shrinkage in the value of the palatial and costly hotels of Northeastern Switzerland, and a blight upon all the thousand and one branches of business which, lying dormant all winter, blossom and thrive during the tourist season from May to October. And not only in Schaffhausen, but also in Zurich, Lucerne, Ragatz, and all the pleasant summer resorts along the beautiful Lake of Constance would such a shrinkage in tourist travel operate disastrously. Zurich, which is spending millions in beautifying her lake front, and rendering herself still more attractive to strangers, enters through her hotel keepers' association an especially vigorous protest against the project, and her cantonal government, to which of right the application is referred, promptly vetoes it.

THEIR ADVANTAGES.

But notwithstanding the veto, the petitioners return to the charge, alleging that their project involves no injury to the beauty of the falls, and fortifying this assertion by an offer to furnish any reasonable guarantee to that effect. In this form the matter at present stands. It is a question of the practical *versus* the æsthetic. The one side says, "Let us develop our natural industrial resources and opportunities, and let sentiment go;" the other side replies, "See, America has protected Niagara by making it the center of a national park. Cannot as much be done for the Niagara of Switzerland?"

Without expressing any opinion other than that the project seems a most advantageous and feasible one, and that the objections against it do not appear well grounded, I append herewith a translated extract from a communication which recently appeared in the *Neue Züricher Zeitung*, of this city, and which certainly presents the case in a sensible and practical light. The writer says:

If, for instance, some one should come and ask a concession for the establishment of a mammoth cotton-mill, we should say to him, "There is no good reason why you should pitch upon the Rhine fall. You can find elsewhere in Switzerland water-sufficient to carry on your undertaking. Moreover, we are well posted on the subject, and we doubt in any case, whether your project would be profitable to the Swiss industry."

THE FALLS OF THE RHINE AT SCHAFFHAUSEN.

condition, dependent upon great water-power, and therefore Switzerland, whose industries in other respects are lacking in natural advantages and favorable conditions over her competitors, possesses in the present instance an advantage of which she should avail herself in season. Wherever the manufacture of aluminum in large quantities first meets with success, there the kindred industries for working it will in all probability settle, for the reason that in such case a still further advantage would ensue, an advantage offered by no other branch of Swiss industry.

Our machine industries complain of high freights, for iron is indeed heavy; but, in the industries allied with the manufacture of aluminum, the question of freights would assume a minor importance, as aluminum is of such light weight.

For years past people have been saying, "Wait until greater progress has been made in the application of electricity, then, thanks to our water-power, we shall have an easier part to play in the industrial struggle," but now, that the longed-for period is approaching, shall we not take time by the forelock? Such opportunities are rare and do not easily recur. When a chance is offered us of perhaps twenty thousand men finding work in Switzerland within the next fifteen or twenty years, through the introduction of the manufacture of aluminum, we may console ourselves for the loss of a little water from the falls of the Rhine.

Ruined the falls will not be, for it is only at the time of the lowest water-mark in winter that they will be really affected at all; besides, nobody ever goes on the Rhine in winter time. For the remainder of the year precautions can be taken and conditions imposed which will afford ample protections.

UNITED STATES CONSULATE,
Zurich, February 11, 1887.

GEORGE L. CATLIN,
Consul.

AGRICULTURE IN BADEN.

REPORT OF CONSUL MONAGHAN.

AGRICULTURAL EDUCATION.

Officials, assistants, institutions, &c., connected with and making up the agricultural department:

- (1) A technical institution for encouraging the improvement of horses by giving instruction as to improvement of blood, &c.
- (2) Agricultural station of chemical analysis at Carlsruhe.
- (3) Permanent exhibition of agricultural books and means of instruction, such as models, &c. Permanent exhibition of agricultural implements and machines.

This exhibition forms a very important part of a permanent exposition of the various industries of the state. It is under the supervision of a ministerial commissioner.

- (4) Meteorological stations: These are scattered all over the state, but have a central office at Carlsruhe. There are nineteen stations in Baden.

- (5) Agricultural schools: (a) An agricultural school at Hochburg, with one principal and two assistant teachers with a helper. (b) The school for teaching methods in production, care, &c., of fruit trees, at Carlsruhe; one principal and an assistant teacher, with an "overseer." (c) Agricultural winter schools at eleven different places in the Grand Duchy. Each of these schools has teachers of training and skill in their departments.

A principal or 1

HORSE-BREEDING.

The interest manifested by the Government in obtaining good clean-blooded horses from Normandy for breeding purposes is deserving of unstinted praise. Every year the best obtainable stud-horses have been purchased and sold again, at very moderate prices, to agricultural societies in the various districts, for use in propagating good stock. Sometimes they are sold also to corporations and to private parties. Then, again, in many cases the Government allows certain amounts of money to owners of such animals, enough for their keeping. Again, premiums in money amounting to thousands of dollars are given yearly to those producing the best results. Men possessed of the necessary technical knowledge go from village to village, holding meetings and giving instruction in the care and breeding of horses. The magnificent brutes, marvels of strength and beauty, which one sees, worthy offspring of their Norman sires, speak eloquently for the steady care and intelligent selection of the Baden authorities.

A law has been passed and put in full operation, under which a commission is appointed and charged with looking after and examining the various studs, public and private, and declaring as to their fitness for breeding purposes. No stud is allowed to be used for such purposes unless the owner or owners can show a certificate signed and sealed by this commission acknowledging the stud's qualifications as a breeder. These certificates are good only for a year. Of course this commission is composed of men skilled in the breeding or possessing technical knowledge in relation to horse-breeding. Everywhere an intelligent interest has been awakened. The little village meetings have done much good in encouraging thought in the matter of selection of good blood and in preventing the thousand and one evils to which young horses are liable. The many evils consequent upon bad shoeing and carelessness in regard to stalls, &c., &c., have been partially removed. A new movement is on foot to establish courses for young men studying horse-shoeing in order to give them full technical knowledge of the hoof and its care. The last report I have been able to see gives the amount of money spent in encouraging horse-breeding at 72,262 marks, or about \$17,183. It has averaged that much for the last ten years. Thus we find government intelligently working with nature in carrying out her great law in seeing that only the fittest shall survive.

ANALYSIS STATION.

The scientific analyses which the agricultural analysis station makes every year are given to the public through the columns of various agricultural papers. The principal work done by this organization, noted in its last report, was as follows:

(1) In regard to wine: Influence of the dross, or pomace, of the acetates and sulphurous ingredients. The influence of allowing the juice to heat, both upon its working, fermenting, and upon the wine afterwards. Results from mixing stuff with the wine to such as roots

(3) Analyses of dungs and various manures; experiments with the same upon vines, plants, trees, and vegetables.

(4) Experiments with the various kinds of waters and essences produced; analyses of the same, &c.

(5) Experiments with, and tests of, methods for producing rennet essence.

(6) Analyses of manures mixed with loam, and experiments with the same; analyses and tests of butters, flour and meals, barleys, various kinds of feed and fodder, as well as analyses of drinking-water.

(7) In producing means for destroying the various plant diseases and for getting rid of and preventing the growth of harmful insects of every kind.

The station sent out numberless useful and instructive articles on the various matters treated; took also a lively interest in securing and sending out men to lecture upon the best methods of wine culture and treatment; concerning cows; the production of milk, cheese, and butter, and upon the best methods to be employed in planting and producing potatoes. Special attention was given to the matter of watching for and guarding against that dread disease of the vineyards, phylloxera. Special courses were given for this purpose, and special boards appointed to watch, report, and take measures of safety against the very first appearance of the disease.

Many agricultural exhibitions were inaugurated and held under the direction of this station, always with the best results. At these exhibitions all manner of books and models calculated to inform or instruct the husbandman are put on exhibition, all kinds of apparatus, implements, and machines also. Chemical analyses of vegetables were made, in the presence of the people gathered, and explained. The potato was especially treated in this manner. The greatest service, however, done by the station was in answering the thousands of questions submitted to it during the year from all parts of the state.

It might be well to add at this point that agents of American tools, implements, machines, &c., might find a successful sale for their goods by having them exhibited at these fairs, exhibitions, &c., and at the great country fairs. These occur regularly three times a year, the greatest, one, that always awakens great interest, occurring each May, called the "Annual May Market."

RESULTS.

The great advantage which seems to attach to all these institutions is their closeness to the people. Then, too, the constant application of their methods and instruction makes it after a time familiar.

Much of the success of our German farmers in the West may be traced to their early training. It is not an unusual thing to meet an ordinary farmer who is able to tell you some of the great laws of nature; that like needs like to produce it; that what is taken from the soil must be put back in some way or other; that is, to soil from which wheat, oats, rye, and barley have been taken, nitrogen and silica must be given if the soil is not to be impoverished. Where lime-plants *clover* *beans*

ure of sand keeps the soil in a just state of porosity for absorbing gases and heat and imparting the same in even proportions to the roots. He learns what kinds of sands are and are not dissoluble in water, and hence assimilable or unassimilable; that humus must be applied to dry areas; that the soil must be constantly turned for contact with the air, from which it absorbs ammoniacal gases, but holds them so lightly that they are easily drawn over to the young roots, which are ever greedily sucking in nourishment; and so on *ad infinitum*.

GOVERNMENT ASSISTANCE TO AGRICULTURE.

During the last eight or ten years the Baden Government has placed yearly the sum of 234,550 marks to be used in agricultural purposes. This money finds its way into various channels for stimulating excellences in culture and for all the various purposes found in encouraging agricultural pursuits. Besides the above amount 28,000 marks were voted to the Central Agricultural Society, which were used by that society in various purposes, all of which have the interests of agriculture as objective point. The Central Society expended an additional 12,250 marks from its own income. Single districts of Baden, viz, Lörrach, Freiburg, and Offenburg, advanced each the sum of 30,000 marks to be used in premiums for high standards in cattle breeding and improvements in fruit trees. The different agricultural clubs or unions, one of which exists in almost every village, spent about 50,000 marks last year for encouraging enterprise in agriculture. Thus the state, the central, and district unions, &c., spent last year the neat little sum of 414,800 marks, or about 50 marks per hectare of agricultural surface. To this sum should be added 320,000 voted to cover losses occasioned by storms and the various catastrophes to which agricultural products are liable; thus we get a total of 734,800 marks. There are about 800,000 hectares under cultivation. Forty-nine thousand five hundred and thirty marks were spent for the encouragement of agriculture in general; 78,360 for advancing the breeding of horses; 13,720 for improvement of cows, hogs, &c.; 5,900 for fish; 650 for bee-raising; 80,200 for improving and clearing fields; 77,680 for lectures, instruction, &c.; 11,000 for making experiments, chemical and otherwise.

Wherever unsatisfactory results have been reported investigations have been instituted, always resulting in the same verdict, that failure is attributable to unskillful use of farming implements; carelessness in gathering, storing, preparing, and mixing of the manures; in not making a good use of seeds; in neglecting to root out or choke back weeds; to destroy insects in time, or other things injurious to the plants; in too limited care to provide for or against accidental dangers, such as hail, fire, frost, &c., by sufficient insurance; in the imperfect manner in which the fruit is too often gathered, assorted, and stored; finally, in an imperfect and unskillful arrangement and manipulation of the things intended for sale. To remove all these evils, none of which are to exist, and to guard against their future recurrence, no effort

COMBINATION AND CO-OPERATION AMONG FARMERS.

Combinations of farmers have been made in many villages for the purpose of buying and using in common machines and implements of the latest and most approved make, such as harrows, seed-cleaning, thrashing, mowing, raking, and bundling machines, fruit-driers, &c. Then, again, the farmers have united in districts to buy seeds in large quantities, getting them at reduced prices and saving much on the cost of transportation. The seed are afterwards divided in the presence of all, each man getting a share proportioned to the amount of money subscribed. Artificial manure, feed, and fodder, when needed, are often purchased in the same way. Thus far the system seems to be working admirably. The most important union of the farmers, perhaps, is one organized for mutual protection against middlemen and to realize the utmost possible for their goods. This is especially true of growers of hops, tobacco, and things destined for commerce. Everywhere one finds little banks, called credit-unions, in which the farmers themselves hold all the shares. Very often the village mayor will be the president, and the village treasurer the cashier and treasurer combined, of these little monetary centers. If a farmer wishes to build, or buy land, but lacks the money to begin with, upon finding and giving good security he gets the money at the bank and builds; he never gets more than half of the amount required as security; thus, should principal and bondsman fail, the loss to the union is small and to each member a trifle. Then there are all manner of insurance companies, in which losses by fire, hail, or the elements can be fully covered.

The presence of labor-saving machines soon works a revolution in a village; labor of wife and children, now turned from the heavy and exhausting toil, finds play in a greater care of garden and vegetables, increasing quality and quantity, and hence very materially the annual profits. In this way a dozen small farmers enjoy all or even better results from the new machines than the big farmers, who at one time threatened to drive the little ones out of the field entirely. The good results from buying and using good labor-saving machines and from getting large quantities of seed, artificial manure, and feed, from looking more closely after their sales, have passed a calculable figure; for besides the mere monetary value, they have been productive of many intellectual and social blessings, affording time to the farmer and his family for attending the meetings, for reading, and for social intercourse.

The work of the Government in stimulating and encouraging the farmers has been for the most part general, as its needs must be; but its delegated representatives and agents have worked with an enthusiasm and energy that have been absolutely contagious, the result being a most enthusiastic co-operation on the part of the people. That the work of the Government has been well applied; that their books, papers, pamphlets, and lectures have produced excellent results; that the premiums granted have been deserved is everywhere proven by the fact that among all the states of the Empire Baden receives and deserves her well-earned title, "The Paradise of Germany."

them out in the best manner possible for their future calling, and to do this at the least possible expense to the pupil. To accomplish this the course is so arranged that theory is being constantly demonstrated by practice. The result is that the scholar, even during the two years' course, in contact with teaching and experiment, masters the principles, and returns to hillside and valley to put them in practice. The course embraces the simplest elements of natural science applicable to agriculture, special attention being given to those branches particularly fitted for the school district. Lessons are also given in practical mathematics, reading, and writing. The work of the teachers is very much simplified and assisted by carefully and accurately constructed charts, diagrams, and models; by a good, well-selected library, and by visits and practical talks and demonstrations on the part of successful, well-known, well-skilled farmers.

THE SCHOOL COURSE.

The school course embraces two winters, of five months each, from November 1 to the latter part of March. The course is so arranged, however, that persons unable to return the second year carry away from the first winter's training so much of the best practical training that the loss of the second course is not very great. Still, the teachers all agree that it would be much better for themselves and the scholars if those who enter would complete the course. The second year's work is largely review and demonstration of the first winter's work. When the review is completed as much new ground is opened and gone over as time and thoroughness permit.

The present age, with its restless spirit of search for and improvement in methods of transportation in conducting all kinds of business enterprise, is working great changes in the matter of securing profits from agricultural investments. To-day the farmer must broaden the scope of his intellectual horizon, since he is now in closer relationship with cities distant a thousand miles than he was formerly with those removed only a hundred. To his ability to plough and reap and sow he must add some knowledge. To-day he needs to be as much merchant as farmer, hence he must learn business methods. To-day he has money to invest. The stocking, the hole in the wall or ground have given place to the bank, bonds, rents, mortgages. All kinds of instruments, implements, machines for making labor easy, for preserving fruits and vegetables; are being offered; the farmer must know how to select. In a word, the husbandman of to-day must know ten times as much of what the world calls general and technical knowledge, outside of mere sowing and reaping, as was required of the farmer of fifty years ago. To help the farmer to acquire this information and to teach him how to use it when acquired is the purpose of these agricultural schools. The children of farmers leave the schools practically, as well as theoretically, prepared to help their parents in all the duties and labors of life. Wherever these scholars go the fields and vineyards take a new appearance, the barn-yard and stables more orderly, the better qualities of fruits and

and in none more true than in the sense that people working together work more happily.

To make these schools completely successful the parents are requested to co-operate with the teachers in seeing that their children, when once entered, study and labor industriously, go regularly, and practice at home the lessons learned at school. When farm and school work thus in harmony pleasure and profit are found by the fireside of one and the desk of the other. Only thus can the best results be obtained. These results are sure to appear in the general good, and especially in an improved agricultural system. A maximum of profits with a minimum of loss is sure to follow. Then who will estimate the profits, better than gold, in social and intellectual advancement? Not only are all these results possible, they are being surely if slowly attained in many parts of the Grand Duchy.

THE SCHOOL EXAMINATION FOR 1886.

The school examination of last year, 1886, took place March 20, under the direction of Dr. J. Nessler. The results were more than satisfactory. The guests expressed themselves as very much pleased with the high standard of the work shown. The attention to detail was to every one a pleasant surprise. The winter's work of the scholars was submitted to inspection; the closest scrutiny found little to criticise. This year, 1886, thirty pupils were registered. Twenty-six of these scholars walked to and from school, coming from neighboring villages. The remaining four lived in Ladenburg or came by train.

HOURS OF STUDY.

Each week fifty-seven hours were devoted to school work, each class receiving separate instruction during fourteen hours. The remaining twenty-nine hours were used in imparting both special and general instruction to the whole school. The school hours were from 8 to 12 and from 1 to 4. Thursday afternoons were given to the teachers for rest or recreation. The course of study was arranged as follows:

Subjects.	First class.	Second class.	Both.
	<i>Hours.</i>	<i>Hours.</i>	<i>Hours.</i>
German language	4	2	2
Arithmetic	2	2	2
Geometry and field measuring		1	4
Drawing			2
Penmanship			2
Natural science	2		5
Practical planting	2	4	4
Practical tree planting	2	2	1
Breeding of animals	1	2	3
General agriculture and book-keeping	1	1	3
Treatment of sick and wounded animals			3
	14	14	29

Sometimes part of the time assigned to penmanship was employed in drawing, being considered more profitable inasmuch as the drawing was the teacher of

scientific instruments were supplied. The library was constantly in use, teachers interesting themselves in directing the young readers. Finally excursions were made to neighboring farms, fields, and vineyards to witness regular work and experiments performed by practical farmers. Upon all these excursions the teachers went along to make suggestions, explain methods, and answer questions. It is easy to understand that such methods were crowned with complete success; the interest of the teacher in his work being often surpassed by the scholar's enthusiasm. During the school year money was presented to the "direction" to be used in buying instruments and in granting premiums for good work. Money was also supplied to secure the services of special teachers when such were needed. These moneys came from the grand ducal government, agricultural unions, and private citizens. Hundreds of young fruit-trees were purchased by admiring friends of the school and scholars, and presented to the graduates. These trees will always be the objects of special care.

BOARD OF INSPECTORS AND DIRECTORS.

Each school has a board of directors composed of the leading citizens of the villages in the district. Generally the village mayor (*Bürgermeister*) and selectmen serve on these boards.

The corps of teachers last year were, (1) teacher of agriculture; (2) two well qualified teachers of various branches, language, drawing, and penmanship; (3) teacher of treatment of animals; (4) a general helper.

"TEACHERS' HELP," APPARATUS, BOOKS, &c.

- (1) A very large and fine collection of chemical and physical apparatus, Dr. Bopp's wall maps and charts for teaching physics.
- (2) A collection of models and geometrical bodies, with the necessary implements for teaching mechanics, geometry, and mensuration.
- (3) A collection of minerals and stones in three hundred cases.
- (4) A geognostic map of Mannheim and one of Baden, Wurtemberg, and Hohenzollern land. A mountain and valley map of Baden and Wurtemberg. A large globe and physical map of Europe.
- (5) A collection of seeds.
- (6) A large microscope and a large collection of microscopical preparations.
- (7) A collection of models of agricultural implements.
- (8) A collection of dung, manures, &c.
- (9) A selection of a horse, with many different anatomical preparations, such as hoofs, teeth, &c.
- (10) A numerous collection of drawings and pictures of neat cattle, different breeds of horses, useful and harmful animals and insects; the best kinds of fruits; plans for drainage, irrigation, directing water for use at a mill with undershot and overshot wheels; drawings of instruments to be used in clearing a field of rocks and stumps, besides many maps for a hundred purposes.
- (11) The wall maps for teaching botany and exhibiting diseases of plants, prepared by Dr. Ahles.
- (12) A collection of about four hundred choice books relating to the subjects studied, and agriculture particularly.
- (13) Most of the regular agricultural magazines and journals.

(13) Most of the regular agricultural magazines and journals.

Second class.—(a) Reading: Selections from standards read, criticised, and analyzed; memorizing of selections; reading of essays on agricultural subjects; (b) assignment and writing of short essays on general subjects, on the lesson last read, business essays, letters, reports to superiors, and statements of complaints; (c) dictated spelling exercises, six hours a week; mathematics.

First class.—(1) Reviews of last year's work; (2) Square root, with problems on the same, three hours a week.

Second class.—Addition, subtraction, multiplication, and division of whole numbers of known and unknown quantities; teaching of common (vulgar) and decimal fractions; double-entry bookkeeping, with methods of making statements and accounts in agricultural methods; (3) frequent mental arithmetic, four hours a week.

GEOMETRY.

Plane geometry, including lines and surfaces, spherical geometry, taking in simple bodies; (4) calculation of areas of plane surfaces and contents of simple figures, three hours a week.

DRAWING.

Construction of three, four, and many angled figures; practice in marking and assigning land and in drawing plans; the most important work in projecting, two hours a week. Models are allowed.

PENMANSHIP.

Practice in German and Latin script; models are assigned and used, two hours a week.

CARE AND CURE OF SICK AND WOUNDED ANIMALS.

(a) Healthy care of domestic animals; (b) the external care and external marks of horses, cows, &c.; (c) the most important things in relation to shoeing and care of the hoof; (d) instruction as to how age of animals is told; (e) explanations of the animal anatomy, the internal organs, their functions, &c.; how to assist animals when bearing and bringing forth young; (f) instructions as to what renders an animal unworthy of a guarantee; (g) description of mere passing or transitory diseases to which all animals are more or less liable; (h) experiments and demonstrations on living and dead animals, with practical instruction in bleeding, adjustment of throat apparatus for swallowing, the giving of medicine, &c., four hours a week.

AGRICULTURE, FIRST CLASS.

(a) Special instructions in planting, sowing, weeding, &c., in gathering the harvest, separating the grain, and preserving fruit; the raising of feed and fodder and garden vegetables, &c.; (b) breeding of cattle; how to conduct a dairy; how to feed and with what, where and at what time; hog raising, and the most important points in the breeding, raising, and caring for horses, eight hours a week.

Second class.—The underlying principles of agriculture and natural science. Explanations of those simple, yet, to the farmer, most important things, air and water. Instructions as to the chemical changes which take place in burning, breathing, fermentation, rotting, and decomposition of matter.

Explanations and instructions relating to the kinds of stone, soil, &c., most necessary and beneficial to farm land and for farm uses. The manner of planting and caring for plants, vines, vegetables, &c.; what mode of treatment is best; how they are most easily propagated, transplanted, &c.; their chemical composition and needs; instructions as to plant diseases, how they are discovered and treated.

GENERAL CULTURE OF PLANTS AND VEGETABLES.

Knowledge of soils.—The creation or renewal of soil through allowing stones and other matter to decompose and by special kinds of planting. The component elements and peculiarities of soils. Relative values of the various soils and the kind of plants to which they are severally best adapted. Best mode of (1) tilling and preparing the soil; (2) draining and irrigating.

Instruction in the matter of dungs, manures, natural and artificial. Best methods of preparing and applying, general and special instructions as to kind and sort of plants, vines, trees, and vegetables.

Seeds; Manure; and Vegetables.

IRON MANUFACTURE IN SCOTLAND.

BREEDING OF ANIMALS.

General view of all classes of the animal kingdom, special reference being made to those servicable and useful to the farmer as well as those which are destructive. The chemical constituents and form of the various parts of animals. The organs of the animal their manner of working when in a state of health and when diseased, special attention being given to the organs of digestion, assimilation, and breathing. instruction in breeding, feeding, rearing, and employment of domestic animals for agricultural purposes.

GENERAL INSTRUCTION NECESSARY TO CONDUCTING AGRICULTURAL BUSINESS SUCCESSFULLY.

(1) As to funded capital, (2) working capital, (3) gross receipts, (4) net results, (5) insurance, (6) importance of agricultural unions and co-operation; improvement of farms, fields, &c., by constructing good roads, paths, &c.; irrigation, drainage, and fruit-raising.

All these subjects received careful and special attention. In the matter of agricultural book-keeping each person was compelled to write out an inventory and prepare a cash-book, as if kept for a small farm. Thus the matter was made so practical that to forget it was rendered almost impossible. The branches under N. B.—C, D, and E took twenty-five hours a week. Term for 1887-'88 begins November 3, 1887.

The committee express the opinion that children under fifteen years should not be sent to the agricultural school, only in exceptional cases. Since the course consists of five months only, each pupil should appear prompt on the day of opening and attend regularly to the close.

It may not be without good result to note the following:

The cost for a winter's course is 10 marks, or \$2.50. Children not able to pay even that sum are admitted free upon request or statement of inability.

Persons who enter and complete both terms pay nothing. Attendance at the agricultural school will be accepted by the authorities as equivalent to the same time in another school under obligation.

Attendance at the agricultural school relieves a scholar from further compulsory attendance at school, provided he has completed the agricultural course successfully. Reading books, geometric and drawing instruments, &c., are provided by the school free for the most part, a few being lent for a mere trifle to defray expense of renewing.

The expense for the necessary writing material comes to 10 or 15 marks, \$2.50 or \$3.75. Scholars living at a distance will be taken into respectable families in the village at 1.20 to 1.50 marks per day—that is from 28 to 35 cents per day. Every farmer's son over fifteen; bearing a good name, will be admitted upon application.

For those scholars who live at a distance and are too poor to attend funds are provided to defray both their school and traveling expenses. No boy desiring shall be denied an education. Applications for admission may be made during the entire year to the teachers and board of directors.

Upon a system so excellent, so near to the people, so simple and practical in all its details and workings, so calculated to inspire confidence and support, comment is unnecessary.

J. C. MONAGHAN,
Consul.

UNITED STATES CONSULATE,
Mannheim, March 28, 1887.

IRON MANUFACTURE IN SCOTLAND.

REPORT OF CONSUL UNDERWOOD.

There are six blowing engines, four of them coupled and two of them single. The diameters of the blowing cylinders are, one of 121 inches, two of 107 inches, two of 101 inches, and one of 78 inches. In five of these the length of stroke is 8 feet 10 inches; in the sixth 8 feet 6 inches.

There are 22 boilers; 7 of them "Lancashire" and 15 "egg-end." The length of the two classes respectively is 25 feet and 35 feet; the diameter is $7\frac{1}{2}$ feet. The hoists used are vertical, and are operated by steam.

The hot-blast apparatus consists of 24 cast-iron heaters. No water-power is used. No coal is burned under the blowing-engine boilers, or in hot-blast apparatus. Gas from the furnaces is used for raising steam and for heating air.

COAL.

Raw coal is used as fuel, procured from pits on the Coltness estate, and brought an average distance of 4 miles by railway. Nearly all of it is mined by the owners of the works; very little is bought elsewhere. No royalty is paid to the state. The royalty paid to owners of the soil varies from 4*d.* to 10*d.* per ton on gross weight of large and small. Forty-six cwt. are used on an average for a ton of iron.

IRON ORE.

Ordinary iron of "Coltness" brand is made from black-band and clay-band iron-stone, which comes from the mines 15 miles by railway to the works.

"Coltness hematite" or "Bessemer" is made wholly from English and Spanish hematite ores, which come by sea and by rail. The Scotch ores used are almost wholly mined by the owners of the works, while all the hematite ores are bought.

No royalty is paid to the state for the ores; but 1*s.* 4*d.* per ton of iron-stone calcined is paid to the owners of the soil.

In a charge where both kinds of ore are used there are two parts of black-band to one of clay-band.

All the ores are roasted. For fuel, 1 cwt. of coal is used in roasting a ton of clay-band ore, but none for black-band, as it contains coal. The average quantity of ore required for a ton of iron is 38 cwt.

For flux limestone is used, furnished by the company's quarries, and brought by the railway $25\frac{1}{2}$ miles to the works. All of it is mined by the company. There is no royalty paid to the state, but sixpence per ton is paid to the owners of the soil.

Twelve cwt. is required for a ton of "Coltness" and six cwt. for a ton of hematite.

WAGES.

The following is a list of the various classes of workmen and their working wages:

Occupation.	Number.	Weekly wages.	Occupation.	Number.	Weekly wages.
Masons.....		S.	Engine-tenders.....		
Carpenters.....	4				

Men employed in moving material from unloading place to furnace, two and one-half men per shift for each furnace, paid 4s. 3d. each per shift. Horses and carts are not so employed.

No men are employed in breaking ore or limestone. Limestone is broken by machinery—Blake's breaker.

Of furnace hands the number of bottom-fillers per shift per furnace is two and a half.

TRANSPORTATION.

The average distance that materials have to be wheeled is from 40 to 50 yards. A barrow-load consists of 18 or 20 cwt.

There are no top-fillers. In molding there is employed one boy per shift per furnace; for running the cinder a keeper and an assistant; for running the iron a keeper, an assistant, and fillers.

The iron is run into sand molds. The cinder is run into iron trucks containing 3 or 4 tons, and is hauled about half a mile from furnace to tips. The weight of cinder per ton of iron is about 15 cwt. The men in the foregoing list do not help or remove the iron from the beds. One pig-lifter per furnace removes it. Wages are 30 shillings per week. Iron is moved from furnace 18, 29, and 37 miles, respectively, to shipping points, and is handled but once from beds to railway wagons. It is weighed both at the furnaces and at the railway wagons.

LABOR.

There are fourteen shifts per week. For tending hot-blast heaters one man is required for three furnaces; two are employed in cleaning yard; five in loading iron; two in other yard work; four on cinder tip; nineteen general laborers.

PRODUCT AND COST.

The average annual production of pig-iron is about 100,000 tons. The average annual production per man is 33 tons; average fuel per ton of iron is 46 cwt.; ore per ton of iron is 38 cwt.; flux per ton of iron is 15 cwt. The quantity of ore charged per ton of pig-iron produced is 38 cwt.

The cost of ore per ton charged into the furnace, including royalty paid, labor, materials, and general expense of mining, transportation to furnace, and waste in handling, is 14 shillings.

In the flux (limestone) the percentage of lime is 38 per cent., of magnesia 12 per cent., of aluminum 20 per cent., and of silica 30 per cent.

The cost of flux per ton charged into the furnace, including royalty, labor, materials, and general expense of quarrying, transportation to furnace, and allowance for waste, is 4s. 6d.

In the fuel the percentage of carbon is 52 per cent., and of ash 3½ per cent. The cost of fuel per ton charged into the furnace, including royalty, labor, materials, and general expense in mining, transportation to furnace, and allowance for waste, is 5s.

per ton of iron produced, of supplies for engine-room, black-
consumed, &c., is 1s. 6d.
for coal.

THE ITALIAN SILK MARKET IN 1886

REPORT OF CONSUL CROUCH.

The year opened under the influence of a speculative movement, which I have described at length in a preceding report. The originators of that movement, believing that, considering the reduced production, the lack of competition from Asiatic silk, the small stock on hand in the Italian markets and in Lyons and London, the fair amount of activity among the manufacturers, and the small amount of material held by the latter, the actual prices of raw silk did not represent its real value, secured quietly and simultaneously a large amount of silk in Milan, Lyons, Turin, and other smaller places, and were thus enabled to bring about a considerable advance in the prices. Thus, organzines, first quality, 17-19, sold in October, 1885, for 52 francs; at the end of the year they were quoted at 64 francs.

During the month of January the market was rather quiet, but at its end prices had risen 2 to 4 francs per kilogram, with special reference for raw silk, which latter article was favorably influenced by the large exportations to the United States, and by the growth in public favor of piece-dyed silks. During February and March the market was still more quiet, developing symptoms of weakness, at first partial and then general, which became more decided in April and May, as the new harvest approached. Organzines, first quality, 17-19, were then quoted at 61 and 62 francs. In May everything seemed to indicate a good harvest. The eggs were healthy and in good condition, mulberry leaves abundant, and the weather propitious to the development of the worms. Only after the fourth stage some slight injuries to the crop were perceived, not sufficient, however, even in June, to affect seriously the result.

The quantity of silk-worm eggs, incubated in 1886, was decidedly smaller than in preceding years, with the one exception of 1885, when there was a bad season, and a lack of leaves in the valley of the Po.

The quantity of eggs incubated during the last seven years is indicated in the following table:

Years.	Quantity.	Years.	Quantity.
	<i>Ounces.</i>		<i>Ounces.</i>
1880.....	1,700,000	1884.....	1,400,000
1881.....	1,600,000	1885.....	1,250,000
1882.....	1,350,000	1886.....	1,250,000
1883.....	1,450,000	Average.....	1,430,000

The cause of this reduction was evidently the lack of profit obtained in the previous years, and the lack of confidence in higher prices, together with the improved quality of the eggs, which with the improved methods of cultivation yield a considerably larger quantity of silk worms.

The production of silk-worm eggs may be traced to various species as follows:

According to the figures of the minister of agriculture, the quantity of eggs imported was about 540,000 ounces (27 ounces to the kilogram). Subtracting the 35,000 Japanese, 500,000 ounces would represent approximately the quantity of other species of eggs imported, which are almost exclusively the yellow French eggs. This is evidently erroneous, as the quantity of the Italian eggs is known to be greater than the quantity of the French eggs imported, and this would not agree with the figures given above, which are from a most reliable source.

Taking the average yield of Nos. 1 and 2 of the above table at about 35 kilograms per ounce of eggs, and of Nos. 3, 4, and 5 at about 30 kilograms, the total crop would reach some 41,000,000 kilograms, corresponding to the figure in the table given below. This is a very favorable result for the cultivators, the average of 33.31 kilograms of silk to the ounce of eggs being decidedly above the average of the seven years 1880-1886, as appears from the following table:

Years.	Average to ounce.	Years.	Average to ounce.
	<i>Kilograms.</i>		<i>Kilograms.</i>
1880	24.22	1884	25.76
1881	24.96	1885	26.17
1882	23.82	1886	33.21
1883	28.82		

Further factors which rendered the harvest profitable to the sericulturists were the diminished cost of the eggs, the home-grown eggs taking the place of the more expensive foreign article; the abundance, good quality, and low price of the mulberry leaves, and the fair price obtained for cocoons.

The following table exhibits the results of the harvests of the last seven years, with the prices obtained at Milan:

Year.	Cocoons.	Yellow.	Japanese.	Crossed.
	<i>Kilograms.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>
1880	41,573,189	3.98	3.64	
1881	39,564,091	4.03	3.48	
1882	31,869,076	4.60	3.90	
1883	41,625,299	3.94	3.18	3.64
1884	36,464,663	3.98	3.30	3.69
1885	32,266,017	3.25	2.75	3.00
1886	41,397,323	3.75	3.25	3.50

From this it appears that the yield of cocoons was slightly inferior to that of 1880 and 1884.

The actual yield of the cocoons in silk was less satisfactory. The worms passed through the various stages unusually fast, on account, it is said, of the leaves being older than usual. The chrysalis stage was also shorter than usual. The yield in silk

more rapid. I give the prices of three of the chief articles, first quality, for the seven months:

Months.	Grèges, 7-8.	Trams, 24-26.	Organzines, 17-19.
1886.			
June	<i>Francs.</i> 50	<i>Francs.</i> 57	<i>Francs.</i> 60
July	51	57	63
August	53	57	63
September	54	58	64
October	55	59	65
November	59	61	67
December	59	61	67

After the great activity in these months, especially in goods on consignment, and the filling of the contracts made in the previous months, the market in December became quieter. Possibly the numerous holidays of this month and the general custom of taking inventories at this time may have had influence in this direction. At the same time the political horizon began to assume an aspect unfavorable to all branches of commerce, and the silk market naturally did not remain unaffected. As the demand of the manufacturers ceased the dealers confined themselves simply to filling previous orders, and, believing the demand would soon reawaken, were firm in maintaining the prices at the figures reached, although since they have been obliged to yield, and prices have decidedly fallen.

The increase in the prices of silk during the year 1886 was undoubtedly less due to speculation than in 1885, but rather to the general confidence of the sericulturists, which made them hold out for good prices, and further to the general improvement in all branches of manufacture with its increased demand for raw material, as is indicated by the contemporaneous rise in cotton and wool, and especially to the return of popular favor to all-silk instead of mixed goods. Thus the demand for trams was much more continuous and steady than in the past, where they were replaced by cotton and other surrogates.

The general position of the silk reeling and spinning industry of Lombardy at the end of 1886, as compared with the preceding year, showed a great improvement.

The establishments have been brought during the past few years to a high point of efficiency, and their products find increasing favor. Evidence of this, as well as of the development of silk manufacturing in the United States, is found in the exports from this consular district.

For the four calendar years, 1883 to 1886, inclusive, the exports of raw silk were, respectively, \$2,169,042.29, \$1,980,476.11, \$3,991,270.72, \$4,457,519.50. Previous to 1883 the exports were much smaller; but I am unable to give the exact figures, as there are no digests of the invoice books for those years.

December	71,402	61,105	493,000	58,000

These warehouses, affording a convenient place of deposit for silk, and greatly facilitating commercial transactions, exercise a powerful attraction on the smaller centers of Italy as well as upon other silk-raising countries, especially in the case of cocoons, in which article Milan, the center of a great silk reeling and spinning industry, is becoming more and more the chief European market. Marseilles, previously the most important market for cocoons, is already outstripped by Milan, as is evident from the following table of the amounts held on

The second half of the year was satisfactory for the carding and weaving of silk waste, an industry which is on the increase in Italy, in spite of the vigorous competition of other countries. At present it consumes about two-fifths of the product of Italy in that article, and it is not improbable that practically the whole product will ultimately be worked here.

The manufacture of silk tissues, with the exception of a few houses in Como and Milan, whose products are consumed in Italy and are beginning to find a considerable sale in France, was of little importance, as the following figures demonstrate. The silk goods imported in 1886, amounted to 525,820 kilograms as compared with 486,526 kilograms in 1885, an increased importation of some 40,000 kilograms, while the exportation was 176,990 kilograms in 1886, as compared with 174,043 in 1885.

The following table will show the range of prices during 1886 in other articles not before mentioned :

HENRY C. CROUCH,
Consul.

UNITED STATES CONSULATE,
Milan, March 29, 1887.

THE BANK OF SPAIN.

REPORT OF CONSUL SCHEUCH.

The rapid strides and extraordinary development of commerce and industry in Spain during the last thirty years caused the principal cities to feel the need of establishing an organized system of credit, and consequently many banking corporations were instituted under the law authorizing the issue of notes. These banks, first established in Madrid and later on in Barcelona, made loans discount

commerce and industry, however, gave rise in Barcelona, Madrid, Cadiz, Malaga, Seville, and other towns to a great number of similar institutions, which, by means of the issue of circulating notes, competed with the above-mentioned banks in the facility of furnishing capital for business purposes. The privilege was abused, and this abuse produced a crisis which, in year 1868, placed the greater number of these institutions in the most precarious condition and obliged them to wind up their business.

A law was enacted suppressing the issue and circulation of notes by private banks and creating the Bank of Spain, to which was granted the exclusive power of issuing notes for circulation.

The Bank of Spain, though governed by severe statutes and subjected to the supervision and intervention of the Government officers, is not a state institution, neither are its notes legal tender, nor have they the guarantee of the nation. The public at large have not, however, very clear ideas on this point, the greater part having vague opinions to the contrary, owing to the official nature of the bank, the governors or head officers of which are named by the Government. This and the intimate connection of the bank with the treasury and financial departments of the Government have given rise to the idea of the bank being a national institution, similar to the Bank of England and Bank of France.

In the beginning, when the bank was first established, the public were rather wary and prejudiced against its notes in circulation, but a long series of prosperous years has strengthened its credit, and at the present time its notes circulate throughout the nation and have never been at a discount, excepting on some very rare occasions, in times of political panic, during which the heavy run on the bank obliged it to adopt regularity in its payments, the holders of notes having thus to take each one his turn, assigned on application.

The returns to the shareholders have been constantly on the increase and the rise in the price of the shares has been proportionate. This result has been due to the opportunities the bank has had to carry out all sorts of financial operations on a large scale both with the Government and in the general market.

The credit of the bank and the profits of its shareholders rose to a high degree after the law granting it the monopoly of the issue of notes as currency. The issue of other banks, owing to the natural needs of commerce, had become very large, especially in the capital cities of the several provinces, and in many cases had given rise to heavy abuses, causing serious alarm whenever the country underwent any political commotion, unhappily an important feature in the history of its political and social development.

The bank's credit and solidity suffered but little from the competition that arose on all sides in 1881, when, on account of a temporary prosperity in general business, a great many stock companies were organized. In the desperate struggle for financial existence that ensued, the majority of these companies, established on a fictitious basis, col-

and whose soundness after many years of proof, in the midst of great national trials and convulsions, is established beyond all doubt.

The circular referred to contains the following points:

The shareholders of the bank may have their shares registered in Madrid or at the branch offices and transfer them at will from one office to another.

The shares registered at the branch offices are transferable from one holder to another the same as at the main office.

The dividends accruing to shares are payable at the office in which they are registered, or at any other, at the will of the holder.

The dividends, if so desired, may be credited to any person that the holder may designate.

The bank discounts drafts and promissory notes payable within ninety days, when drawn up with all the legal requirements and having the indorsement of at least two persons of undoubted responsibility, one of whom is inscribed in the bank's lists of credit, which are re-formed annually.

Firms of one or more members and stock companies not inscribed in the bank's lists of credit that wish to have their signatures admitted in the discount of notes and bills by the bank, can request it with the necessary proofs of their sound business standing and solvent condition.

The lists of credit are strictly private.

The bank accepts or refuses the paper presented for discount without giving any explanation of its determination.

Although indorsed by responsible persons, the bank refuses to discount the following notes and bills: All those drawn up in a different form from that prescribed by law; notes or bills with blank indorsements, without date or in different form from that required legally for the transfer of the proprietorship of the note; those which may give rise to any suspicion of fraud.

The paper to be discounted, whether composed of one or more notes or bills, must be presented by invoice, the form for which is given by the bank, and must state the name and residence of the firm asking for the discount; the face value of each note separately; the names and residences of drawer, drawee, and indorsers; the maturity of each note separately.

Paper discounted by the bank must be indorsed to it by the holder, who then receives an order for payment by the cashier.

The bank likewise discounts coupons of the national debt, whether redeemable or perpetual, internal or exterior, and also bonds already called in.

The coupons and called bonds must be presented to the cashier, who gives a receipt, which is in turn exchanged at the proper department for an order of payment by the cashier.

The bank grants loans to reliable persons on bonds of the national debt or of the public treasury up to 80 per cent. of the market value of same, according to the official quotation, for terms from ten to ninety days and for sums not less than \$100.

The borrower must make out his petition on the blank forms furnished by the bank, stating name, residence, security, amount to be borrowed, and term.

If the loan be granted the transaction must be completed by the borrower's presenting an invoice stating the class and number of securities, which is presented to the cashier. Likewise he must sign a duplicate policy, one copy of which is kept by the bank and the other by the borrower. This policy, which is authorized by a broker of the Madrid Exchange, or by a commercial broker if the loan be made by a branch office, states in full the whole transaction.

After depositing the securities and signing the policy, which must be countersigned by the subdirector at Madrid or by the director at the branch offices, the borrower receives an order for payment of the quantity asked for, less the interest agreed upon.

If forty-eight hours transpire after the grant of the loan has been notified to the borrower and the transaction is not completed, the grant is canceled.

The securities for the loan are considered as transferred to the bank without any other requisite but the mere fact of having been delivered for this object.

Should the securities depreciate before maturity of the loan, the borrower is obliged to increase the value deposited in a corresponding amount.

Should the borrower fail to redeem his pledge at maturity or increase the security if necessary, a request to this effect will be made to him in writing. Should he at the expiration of three days after this request still fail to fulfill his obligation, he is at liberty even without judicial process.

The bank opens credits on public values up to 80 per cent. of their market price. Requests for credits must be made out on forms similar to those used in requesting loans and furnished by the bank.

When the credit is granted the securities are deposited with the cashier and a duplicate policy made out and signed with the same formalities as in loans. This deposit must be made within three days after notice of the grant of the credit.

When these requirements are fulfilled the credit is considered open and a check-book given to the holder of the credit.

The holder of the credit may return the amounts taken up on account in whole or in part, the same as with ordinary deposits on demand, a receipt being given for each deposit.

One-eighth of 1 per cent. is charged as commission on the amount of the credit, whether made use of or not.

The bank keeps an account for each credit with mutual interest—interest being charged for the number of days on the amounts taken up and credited for the sums returned. The interest is the same as that charged for loans.

The credits are settled every four months, and the person or firm using the credit must pay the balance due the bank. If failing to do so, the bank orders the sale of the securities in the same manner as mentioned in the case of loans.

The credit once settled, it can be renewed if the bank so chooses and the holder desires it. In this case the balance remaining at the previous settlement is set down as first sum. The renewal, however, must be asked for by the holder, and the transaction is noted down in the original policy.

The commission and interests earned by the credit are charged at time of settlement or before if the holder desires to close the credit.

The interest for each sum deposited or paid out is counted from the same day of such deposit or payment.

The same rules as to property of the securities deposited, and as to method of recovery of amounts delivered at the expiration of the term of credit that have been explained in the case of loans, hold good for credits.

The bank gives drafts payable at its branch offices or by its agents at moderate rates of exchange for sums not less than \$50.

The branch offices also draw on the central office, and on one another in the same conditions.

The bank has already established branch offices in the following cities: Alicante, Badajoz, Barcelona, Bilbao, Cadiz, Cordova, Corunna, Granada, Jerez, Malaga, Oviedo, Palma in Majorca, Pampeluna, Reus, St. Sebastian, Santander, Seville, Taragona, Valencia, Valladolid, Vitoria, and Saragossa; and agents in Albacete, Almeria, Avila, Burgos, Caceres, Castellon, Ciudad Real, Cuenca, Gerona, Guadalaxara, Huelva, Huesca, Jaen, Leon, Lerida, Logroño, Lugo, Murcia, Orense, Palencia, Pontevedra, Salamanca, Segovia, Soria, Teruel, Toledo, and Zamora.

The rate of exchange between one office and another is fifteen hundredths of 1 per cent.

The bank draws on its agents for the amounts it desires to dispose of at the rates of exchange which are posted daily in the secretary's office.

The central bank and its branches take sound commercial paper on towns in which there are other branch offices at rates of exchange posted daily, as before said.

The bank and its branch offices open accounts to persons, firms, or companies that desire it. The request must be made out on forms furnished by the offices and must state residence, business, or profession, name of firm or company, and names of directors.

On opening an account the person or persons authorized to draw on the bank leave their signature in the register for recognition.

The bank refuses to open accounts to declared bankrupts, to persons without recognized property, and to those declared insolvent by judicial sentence, unless legally reinstated.

The bank credits to depositors sums paid in its notes, in gold or silver coin, or paper payable within ten days.

The first deposit must not be less than \$500 in Madrid or \$100 at the branch offices, following deposit not less than \$50.

Checks must be signed by those in whose name the accounts are kept open, if private individuals, or by the authorized representatives of firms, companies, or corporations. Individuals may also authorize others to sign for them either by power of attorney or by written communication to the directors of the bank or branch office. In all cases those authorized to sign for others must leave their signature at the register for recognition.

Checks should be for sums not less than \$25, except for balance of account.

The amounts for which the checks are drawn must be stated both in writing and ciphers.

The bank is not responsible for any loss occurring on account of the loss or theft of checks or check-books, but it will stop payment of a check when not already made if the drawer notifies it to do so, until it is legally decided to whom it should be paid, the amount being kept meanwhile in deposit.

The bank closes the accounts of those overdrawn their balances and refuses to reopen them.

The bank refuses all information to third persons respecting funds deposited, unless so ordered by legal mandate.

Accounts will be closed when those for whom they are kept request it, or when, the balance being lower than \$20, six months transpire without further deposits.

The bank detains all persons handing in illegitimate checks, when so proved.

Persons or companies having credits at the bank or its branch offices may dispose the transfer of sums from one place to another where the bank has an office, in favor of other persons with accounts open at the place to which the transfer is made.

Persons, firms, or companies desiring to make a transfer send a check to this effect to the office in which their account is kept, stating clearly in writing and ciphers the amount to be transferred, the office to which the transfer is made, and the name of the person, firm, or company having an open account at the latter office to whom the amount transferred is to be credited.

The transfer checks before being admitted are compared with the original stubs to certify their legitimacy. This done, and the credit of the drawer seen not to be overdrawn, a receipt is given for the amount transferred made out in favor of the person to whom the transfer is ordered, although the latter is not obliged to present this receipt to draw on the amount transferred and credited to him.

Individuals having open accounts at the bank or its branch offices and who reside outside the town in which the office is located, or who happen to be absent from the said town, may remit drafts or notes to be credited to their account after collection. These remittances must be duly invoiced, stating the names and residences of the drawees; and when more than one draft or note is to be collected, the amounts becoming due at the same date, which must not be beyond a term of ten days, should be grouped together.

The notes and bills to be collected must fulfill all legal conditions and be indorsed to the bank or branch office where the drawer or indorser's account is kept.

The bank or branch office performs all the duties requisite for the collection of the amounts thus remitted, such as presentation for acceptance and payment or protestation in case of failure to accept or pay, charging to the drawer's or indorser's account the expenses for same in the latter case. In case of protest, the bank notifies this fact by the first mail to the drawer or indorser.

Should the balance standing to the credit of the drawer or indorser be insufficient to cover the expenses in case of protest, the bank, on notifying the protest, requests said drawer or indorser to cover the difference. The bank reserves to itself the right to close the accounts of persons who make frequent remittances that require protest.

The holder of an account may draw on his credit by an ordinary commercial draft, but he must notify the bank of this draft, stating number, amount, name, and residence of payee, and term. This letter of advice is sufficient for the bank to debit the amount drawn to the drawer though the draft be not presented.

The holders of accounts may also make payable at the bank drafts drawn against them if they so state it on the drafts on accepting them; and at the same time notify the bank of the fact, which notification, as in the former case, is considered sufficient for the debiting of the amount to the account of the drawee.

Persons, firms, or companies residing outside of the legal residence of the bank or branch office where their accounts are kept may make use of payment and transfer checks the same as the residents in the town where the office is located.

Share or bond holders having their values deposited at the bank or its branches may request the bank or office to credit to any of

When an order has been given to credit accounts with dividends or interests accruing from shares or bonds deposited at the bank, a counter-order may be given at any time; but the extracts of inscription or the deposit receipts must be presented to have the new order stamped on them.

Any person acquiring, through indorsement or other means, the property of values deposited at the bank should see that the receipts for same bear no mark indicating that the dividends or interests accruing to them are made payable to third persons. As the bank keeps no register of indorsements, when the receipts bear the aforesaid indications the owners will find it convenient to take up the deposit and renew it in their own name, or give a counter-order, canceling that of payment to third persons.

The bank keeps special current accounts in public values, the same as for money on demand.

The accounts will be opened in the name of known persons, who must sign the first invoice of values delivered, and besides have their signature at the register for recognition.

Each account must refer to one class of values, although several accounts of different classes of values will be kept in the name of one and the same person.

Holders of current accounts of this kind may draw on the values thus deposited by means of checks with double stubs, stating the series and numbers of the titles to be delivered.

Coupons of values thus deposited will be cut and collected on specified days, except when the owners notify their express desire to leave them uncut; and all new deposits must have the same coupons and no more than those already deposited.

A moderate commission is charged for the keeping of these accounts, viz, $\frac{1}{2}$ per cent. a year on the interest of values that yield it; $\frac{1}{200}$ per cent. on values that do not draw interest.

This commission is charged half-yearly, deducting the amount from the interests or dividends collected on those values having the same payable half-yearly or quarterly, and annually when the interests or dividends are so payable.

The bank accepts deposits of coin or notes on trust, whether voluntary, obligatory, or judicial. Voluntary deposits are transferable or not. All these conditions are noted on the receipt given for the deposit.

The deposits must be accompanied by an invoice signed by the depositary, who must also leave his signature on the register for recognition.

No voluntary deposit under \$50 is admitted, nor any that are not multiples of 5; but several receipts will be given, if so desired, to one and the same person when not under \$50 each.

A deposit on trust can only be taken up in entirety. Nothing is charged for safe-keeping on trust deposits in coin.

The bank also accepts voluntary obligatory or judicial deposits on trust of public values.

Under this denomination are comprised national and treasury bonds, shares and bonds of legal corporations, listed at the exchange, and similar values of foreign countries.

Voluntary deposits are made transferable or not, at the will of the depositor, for which receipts are given.

These deposits are made under double invoice, stating the name of the depositor; whether they are transferable or not; the class of values deposited; their numeration, beginning with the lowest, and their nominal value. This invoice is signed by the depositor, whether the deposit is in his own name or in another's.

A separate invoice must be made for each class of values, and also for values of the same class when the numbers cannot be clearly stated.

The bank gives temporary receipts at the time of deposit, which are exchanged on the following day for definite ones.

The bank has the legitimacy of the values certified to by the issuing offices, and notes down this certification on one of the invoices.

Deposit receipts may be transferred by indorsement from one person to another. The bank delivers up the deposit the following day after being so requested, and after the premium for safe-keeping has been collected.

For every deposit receipt a duplicate will be given, after advertisement, with-

Should the holder of a deposit receipt die, the values will be given up to his lawful heirs, who will have to show a certificate of his death and a legalized copy of the testamentary clause by which they are named heirs, or of the judge's decision declaring them such, when the former holder dies intestate.

The bank collects the interest due on bonds of the national debt, the public treasury, or of private corporations, when payable at the place of deposit. The coupons are cut from the bonds forty-five days before payable, and no deposits are accepted having previous coupons attached, or even the current one, if within forty-five days of payment.

Coupons will be given up in full at any time by the bank to the depositor if so requested when more than forty-five days are intervening before payment.

When a deposit is requested to be returned, after the coupon to be collected has been cut off, the bank gives a receipt for the coupon payable after collection.

Shares or bonds not having coupons and which have to be presented integral for the collection of dividends or interests cannot be given up by the bank until they have been returned to it.

Proceeds from values on deposit will be paid to the holders of receipt, unless a judicial decision is pending, or they may be credited to any one having an open account at the bank or any of its branch offices.

For values to bearer, one-half of one per cent. on the interest collected is charged for safeguard per year.

For values not drawing interest, one two-hundredth per cent. of the nominal capital is charged.

For registered values, one-half of the above amounts.

The minimum amount charged for safe-keeping is \$0.05.

The premium for safe-keeping is due from the day of deposit to the day it is taken up, fractions of a year being counted by months and the last month will be counted as a whole one if more than fifteen days have elapsed, and as half a month if less.

Dues are collected on returning the deposit.

Certificates of register of the bank's own shares are accepted on deposit without charging any dues.

The bank collects the value of those bonds called in for redemption which are on deposit, no steps being necessary to be taken by the owners.

If while bonds have been deposited with the bank, any should be redeemed, on returning the deposit, the amount collected from redemption is given instead of the bond itself.

The bank transfers from one office to another values deposited, at the request of the owner, on his account and at his risk. This transfer is made through the mails fulfilling all the conditions established by the postal laws regulating this class of transaction.

When such a transfer is ordered, the owner of values deposited signs a receipt in full of same, pays the premium for safe-keeping up to date, and likewise the cost of transfer. In return, a provisional receipt will be given, exchangeable for a definite one after arrival of the values at the office to which they have been ordered to be transferred.

The bank also receives valuables and jewelry on deposit, which must be placed in cases, of which a double invoice has to be presented stating the value of the contents. The cases must bear distinct marks and inscriptions, and have strong bands when the size or weight requires them.

After comparing the contents with the invoice, the cases containing the valuables are closed by the depositor and bound and marked with both his and the bank's seal. A provisional receipt will be given on the day of deposit, to be exchanged on the following one for a definite receipt.

No deposit will be accepted of more than one case at a time, nor of any case whose declared value exceeds \$15,000.

The bank only undertakes to retain the deposit in the same state in which it has been made, and is not responsible for the value assigned to it, nor for any deterioration owing to the nature of the valuables deposited, time elapsed, atmospheric changes, or any other cause not directly dependent on man's intervention.

The bank charges for these deposits one-twentieth of 1 per cent. on the declared value, quarterly, during the first year of deposit, and one-tenth of 1 per cent. quarterly every succeeding year.

The bank and its branch offices will collect private drafts payable at home abroad, but does not cash them until advised of the same.

DANISH DAIRY PRODUCTS IN ENGLAND.

Collection of interest and proceeds from redemption of national bonds that the bank is encharged to pay may be made at any of the bank's offices without commission, bonds deposited at the branch offices having the same advantages as those deposited at the bank in Madrid.

FRED'K H. SCHEUCH,
Consul.

UNITED STATES CONSULATE,
Barcelona, Spain.

DANISH DAIRY PRODUCTS IN ENGLISH MARKETS.

REPORT OF CONSUL RYDER.

Thanks to the great rapidity of communication, combined with the low cost of transport, distant producing countries are enabled to compete successfully with the home produce in the supplies of all description of agricultural products.

Thus, as regards milk. Whilst the great capitals and larger cities in former times were chiefly supplied from cows stalled on the spot, or in the immediate neighborhood, this is now totally changed. Paris, for example, is receiving her daily supplies of this article from Switzerland; whilst London is furnished with the needful daily requirement for her dense population from the remotest parts of the Kingdom. Holland, it is said, has even commenced to take part in this traffic, although it would appear to be very doubtful if such movement is being attended with success, as the Dutch milk will scarcely find favor in the London market, where the milk of the present day is unquestionably of very superior quality. Here in this country it is felt among the dairy proprietors that although they might with all confidence be fully able to satisfy the demands of the London consumers as regards quality, the cost and risk attending the long sea voyage would be too great to admit of remunerative results. The milk during the voyage would have to be kept down to 10° or even 8° C., in order to prevent the formation of butter, or souring, and it would be of little use to think of employing antiseptic means to counteract these dangers, as the London milk dealers would, without doubt, use all their influence to have such milk declared by the milk inspectors adulterated.

Cream, which brings enormously high prices in London, might be better able to support such expenses of transport; but as it can now only be viewed in the light of an article of luxury in London, and is only used to a limited extent, it cannot be looked upon as an export article of any material consequence.

As regards cheese, of which there is consumed in England a very large quantity and mostly of very good quality, the Stilton and Gorgonzola cheeses stand notably highest in price. Of American cheeses, very considerable quantities are sent to the English markets; whilst other dairy cheeses are found to be quite unsalable. More-
that the

The prohibition against the introduction of live swine into England from this country has led to the erection of a large number of hog-slaughtering establishments all over this Kingdom, from which a considerable export of bacon is now carried on, but of which, unfortunately, the greatest part first passes through the intermediate hands of Hamburg dealers. It is also matter of complaint that the Danish swine are in great part too highly fattened and not sufficiently fleshy, and that it would be more advisable if the animals were slaughtered at the age of three to five months, rather than that of five to seven months.

Next as regards butter, by far the most important dairy branch in this country. The present mode of carrying on the trade in this article is of the following nature: In the very first days of the week the butter is forwarded by the dairy proprietors to the different export merchants, who collect the same, and by these it is again dispatched towards the close of the week by the cattle steamers to England, arriving in London on the Friday afternoon, so as to be in time to come into the Saturday market of that city; whilst its arrival on the markets of the north of England and Scotland first takes place on the Monday of the following week. The Danish butter will thus, on its arrival in London, be about eight to nine days old from the time of its leaving the dairy, and on the northern markets of still older date; and whilst passing through the different hands of the provision merchants, the grocers, and small dealers, a period of fourteen to thirty days may fairly be said to elapse before it reaches the consumer, and for such length of time it is absolutely necessary that the butter should remain in perfectly good keeping condition.

Under the present conditions, that which is now demanded of butter, so that it can command a high price, is that it should be of very fine quality and of good keeping properties, and, so far as concerns the fineness of quality, it will be necessary that producers should regulate themselves according to the taste and demands of the English consumers. The most exacting of the consumers require that the butter should have the taste of sweet cream, and that it shall be carefully washed out and unsalted, like the French butter. As this description of butter is, however, confined to a more limited class of the English community, the producers are recommended to use due caution against exposing themselves to the risk of an overproduction of such an article, as it must be borne in mind that this fresh, unsalted butter is now even sent from Italy to the London market, and that it is only a minor portion thereof that can be said to command the desired top prices. The great drawback to this unsalted butter consists mainly in the difficulty of its being kept in perfectly sweet and fresh condition, as well as the losses which may have to be submitted to on all such occasions when a speedy sale from one cause or another may be impossible.

The English dairy companies would appear to lay themselves out more in the production of a slightly salted butter, so-called Dorset butter. Herein lies a hint to the producers in this Kingdom as to the class of butter to which their attention might be most profitably directed. The great masses of the English public may be said to be fully satisfied with the quality of the butter sent from the

With such an extensive range of customers, a sale can easily be found for the whole of the butter exports from the Kingdom; and it is certainly far safer to build an export trade upon the wants of the great masses than on the limited circle of the wealthy classes. Complaints, unfortunately, are at times heard from England that the butter from this country is somewhat too strongly salted; but on the whole it is not advised to make any alteration in this respect, as the great mass of the customers seem to be quite satisfied with it as it is. It is, however, strongly impressed upon all dairy proprietors that the greatest attention and care should be devoted in the making of the butter, both as regards the kneading and salting, as well as in the laying down in the casks, so that it may be as far as possible of one uniform character.

Too frequently the malpractice is to be observed in a defective washing. The water should be entirely removed; as otherwise the butter will be wanting in proper consistency.

These remarks would seem to be specially directed towards the managers of the Union dairies; more especially in reference to their winter product, and in consequence of which drawbacks their articles seldom obtain the highest prices; and as these Union dairies are of immense advantage to the large number of peasant proprietors in this Kingdom (some 70,000 in number), it may be said to be of national importance that the product of these Union dairies should be more strictly attended to from beginning to the end.

In respect to a more frequent communication with the English markets, it is the opinion here that so far as the northern ports and those of Scotland are concerned, no great benefit would be derived thereby, but that on the other hand for the London market, where their competitors have almost daily communication, it would certainly be very desirable if more frequent intercourse could be established.

Again, it has been proposed that the butter should be packed in casks of smaller size than the present, so that it might be sent in many cases direct from the producer to the consumer; but it would, nevertheless, appear to be more generally held that the present drittle cask, in point of view of cheapness, convenience, and handling, and for good preservation of the butter, is absolutely the most suitable mode of packing; and when Italy has adopted a similar style of package, this is undoubtedly to be attributed to its good points rather than to the desire on the part of the exporters from that country of imitating the Danish form of cask. It is, however, strongly recommended that these casks should, as much as possible, be of one uniform size, and not containing more than 100 pounds, English weight. Whilst the Danish exports of butter to England have been steadily on the increase in the latter years, those from France have been meeting with a decline; but, unfortunately, it cannot be concealed that the exports from Holland and other countries of the article of butterine to the English markets have of late years been steadily and largely increasing; and it is from this export branch that the Danish butter trade is most dangerously threatened.

The Dutch butterine, partly unmixed or in part mixed with butter, is the latter being

marks on the casks is only too palpable. The remedy against this crying evil can only be looked for in a more careful and more stringent mode of inspection on the part of the English officials to defeat this disastrous traffic.

Butterine, it cannot be denied, as before said, is the enemy most to be dreaded by the dairy proprietors.

The finest description of butter will unquestionably always meet with a ready sale; but the danger lies in the article of more or less inferior quality, and it cannot therefore be too strongly impressed upon all butter producers that the butter made from milk where the cows have been abundantly foddered with swedes or turnips can never be expected to obtain the highest prices; and with the dreaded competition from butterine, together with the very keen competition which has to be encountered in the English markets from their Irish and other numerous competitors, it will become absolutely necessary to strain every nerve towards the production of a first-class article if the Danish dairy classes do not wish to succumb to the competition of these two dangerous opponents. It cannot, either, be too forcibly brought to the remembrance of all connected with the dairy business that whilst the manufacture of butterine is year by year being largely on the increase, the quality of this article is likewise at the same time steadily being brought to greater perfection, and that its competition with the lower grades of butter will, as a natural consequence, with each succeeding year become a struggle of greater intensity.

HENRY B. RYDER,
Consul.

UNITED STATES CONSULATE,
Copenhagen, September 30, 1886.

IS DANISH BUTTER DETERIORATING ?

REPORT OF CONSUL RYDER.

It may be as well to observe, in the first place, that it was first in the years 1870-'78 that the great development in the butter exports from this country can be dated, and that it was likewise at that period that this butter had obtained its high repute on the foreign and more especially in the English markets. It was then a constant theme in the correspondence of the English provision traders to their constituents in this Kingdom that Danish butter was the best in the world, and that it was greatly sought after in all the English markets owing to its vast superiority over any of its competitors. The dairy farmers here still try to flatter themselves that they are yet maintaining this position of superiority over all their rivals, and spite of complaints, which are becoming more and more frequent, that the quality of their butter is no longer of the same high standard as formerly, they seem scarcely inclined to pay sufficient attention to these remarks. In the mean time it would appear that these complaints are day by day more accentuated, and the opinion is constantly expressed that this butter is in several degrees in quality de-

treme difficulty, to bring forward any decisive proofs of the correctness of these assertions; but nevertheless it would seem to be the general opinion of these experts that Danish butter can no longer be said to maintain its former lead in the foreign markets, and that the sales are attended with more difficulty than in former years. It is at the same time remarked with much justice that too great attention should not be paid to the low prices which have been the rule of late in the butter market, for whilst all other produce has in recent times had to submit to a decline of several per cent., it could not otherwise than be expected that the turn would also come to the butter markets.

By the exporters it is held that of the exports in the present day from this country no more than 20 per cent. thereof can be fairly entitled to rank under the standard of very finest and faultless class of butter, and that it is not even of unusual occurrence for some of the casks of the most renowned brands from the large estates to be rejected on arrival by their English customers as not coming up to the stipulated requirements, which was a thing almost unheard of in former years, and that the purchases on the spot by English traders may be said to be confined to this fractional amount of the exports, whilst the remaining 80 per cent. have now to be shipped on consignment at the risk and cost of the Danish shippers.

Whilst these exporters and all who are intimately acquainted with the trade are ready to admit that Danish butter still holds its prominent position in the English markets, this praise, they add, must, however, be confined to the before-mentioned fractional part thereof, and that how far this may exceed or be below the stated 20 per cent. it is difficult to say, and these views are strongly corroborated by the published reports of the different exhibitions of dairy produce which have been held throughout the Kingdom in the latter years.

These reports are in no way in contradiction of the opinions held by the exporters and those acquainted with the trade when they say that only one-fifth of the Danish butter can at the present time be considered as being of very finest quality, inasmuch as by the decision of their own judges premiums for butter of very finest quality were only awarded to one-fifth of the exhibited brands; and at a large butter show lately held in the town of Kjöge the results were almost the same, premiums having only been awarded to 43 out of a number of 239 exhibits, and that here, as at other shows, the premiums were mainly awarded to the butter sent from the large manorial estates, whilst the medium-sized dairy farms, both with regard to the quality of their products, are far behind in respect to the quality of their products.

It seems to be the concurrent opinion of all that the two leading factors in connection with this retrograde movement may be sought for under the following heads:

First, in the course pursued in the foddering of the cows.

It is well known that when in the seventh decade of this century every exertion was made to promote the improvement in the quality of the feed, it was generally impressed upon all dairy farmers that a good diet should consist of wheat bran and the in-

should be considered as constituting highly objectionable fodder materials for milch cows. It is true that at the present time both oats and rape-seed cake as well as a certain amount of bran are still used; but when attention is drawn to the trade now carried on with various kinds of feeding stuffs in all the districts, it is at once noticeable how largely the sale of bran has decreased, whilst on the other hand the sale of other modern fodder materials, such as earth-nut cakes, cotton seed cakes, turnsol-seed cakes, &c., has been on the increase. Whilst fully admitting that these rich oil cakes can be bought by the dairy farmers at less cost than the bran, the question is plainly put before them of the influence exercised by these feeding stuffs on the quality of the butter, and it is feared that it cannot be denied that it has been too generally the custom to depart from the most successful and best of all feeding stuffs to replace them with others of more doubtful value, and so far as turnsol-seed cakes are concerned, certainly with one of more injurious tendency. To this it may also be added that in parts of Jutland it would appear a general feeling of confidence has of late been placed in the use of turnips as feeding material for their cows; thus, whilst for ten years back this was considered as the most pernicious of feeding stuffs in connection with the quality of the butter, it is now too generally advocated as affording good milk fodder.

Even in the agricultural journals articles are frequently to be met with strongly recommending a liberal use of turnips (1 to 2 bushels per cow daily) as being an economical as well as lucrative fodder for the cows, and it is at the same time maintained that such liberal supply of turnips places no obstacles in the way for producing the finest quality of butter; but that it will always be advisable to put a suitable amount of saltpeter into the milk or cream to neutralize and remove any bad taste that might be caused through the use of the turnips. This seems plainly to indicate that in the latter years too great weight has been placed upon obtaining an increased production, whilst a less careful attention has been devoted to an appropriate course of foddering, in connection with the desired quality.

Regarded in a purely economical point of view, no one attempts to dispute that it is possible to produce a larger yield and at less cost with the aid of turnips as main article of fodder in comparison with other feeding stuffs; but when it is asked what influence the various feeding admixtures have had upon the quality of the butter, so surely will turnips and saltpeter not be considered as having constituted one of the agencies that have conduced to the fineness and reputation of the butter produce.

Turnips, it is further admitted, have frequently been given in large quantities in the autumn, when the cows are removed from the fields during the first weeks of their being brought into their winter stalls, when it is an object at as low cost as possible to guard the cows against a too great falling off in milk during the change from grass to winter fodder, and it follows to reason that this course of foddering will yield a large amount of milk; but, notwithstanding that a suitable quantum of saltpeter was put into the milk, it was never acknowledged by competent judges that the butter could be denominated as good. all the attempts that have been made to improve the quality of butter produced from turnips

same amount of butter as can be obtained with turnips, and judging from all experience it may with safety be said that turnips and saltpeter can be set down as one of the main factors in lowering the previously high reputation of Danish butter.

Secondly, to a greater laxity in the care and attention so constantly called for in all dairy operations.

Here as well as in the relaxed care paid to the foddering of the cows just as little praise can be awarded on this score for any earnest attention in the carrying on of the work so as to secure the requisite training to give assurance of proper preparing of the butter, and again it must be noticed that whereas in the seventh decade of this century it was generally admitted that although on the large as well as small dairy farms, whilst following their old customs and practices, they might be able to make good butter for their own use, they were, nevertheless, entire strangers to those new and improved modes of procedure which have to be pursued when fine butter has to be made for sale, and when in these sales have to be looked to as a main source of income.

It was at that time deemed absolutely necessary that such modes of procedure should be carefully taught, and in furtherance of these views well-trained assistant instructors were kept in constant activity in going from dairy to dairy, where an eager desire was felt for guidance and instruction, and their labors were so well carried out that a full knowledge and practice in the modes of preparing the finest class of butter was widely spread throughout the land. But it has been the greatest mistake to imagine that this knowledge once acquired could be kept up without fresh nourishment and support. Even the most capable dairy helps, who have been educated and brought up to the work, will become lax in their work after a time and by degrees contract objectionable habits unless they can occasionally look around and obtain fresh ideas from others conversant with the business and thereby be in the position to become acquainted with such new and improved methods as may be taking place outside of their own circle.

Such instructions unfortunately are no longer so eagerly sought after in these days. One and all seem to consider that they are sufficiently educated and skilled in their work, and the result of this apathy and self-conceit is to be seen whenever this previous active agency has been discontinued; and it may be added that the large dairy proprietors have not either shown a good example in this respect. In former days also the Agricultural Society took an active part in promoting the practical education of the dairy helps; and, in conjunction with their exertions, a private dairy school was established in the island of Zealand, which has been the means of sending out into the world a number of well-taught and efficient dairy people, and it must always be a matter of regret that the Agricultural Society were influenced in the discontinuance of their work of practical education, on the grounds that this private work was of such extensive character that their interference was of no great value. The private educational work is without longer called for. *but it is scarcely of that solid and*

I am at the same time of the opinion that a third factor might have been brought forward as having materially contributed to this deterioration in the quality of the butter. I would allude to the large number of Union dairies which have been established in the latter years all over the country, to which, as I mentioned in previous dispatches, the great development in the butter exports have been in large measure due, whilst at the same time, from the numerous difficulties which these dairies have to contend with, it is universally acknowledged that the produce from their works has never been classed under the standard of finest and faultless butter, but rather the reverse.

HENRY B. RYDER,
Consul.

UNITED STATES CONSULATE,
Copenhagen, November 9, 1886.

ACQUIRING LAND IN SUMATRA.

REPORT OF CONSUL ECKSTEIN.

Application has recently been made to me by parties in the United States for information as to the Dutch laws concerning the purchase of plantations in Sumatra by foreigners, and whether foreigners can acquire land in Sumatra, and under what conditions.

The India Mercury, a weekly journal devoted to colonial affairs, and published at Amsterdam, in its issue of last week contained an article discussing the subject of Americans apparently contemplating to enter the field (I might say "fields") of Dutch East India by procuring lands in Sumatra for purposes of tobacco cultivation.

Believing that this matter may be one of more or less importance to certain of our citizens, and that inquiries regarding it may possibly be made at the Department, I concluded that furnishing some information on the subject might perhaps be appreciated.

With this end in view I solicited at and obtained from the department of the colonies at The Hague a written statement, of which the following is a correct translation, viz:

Agreeably to your favor of the 25th instant, I herewith beg to furnish you with some information concerning the granting of lands for agricultural enterprises in the island of Sumatra.

In all the regions (*gewesten*) of that island, which are under the direct administration of the Dutch Government, the governor-general is empowered to grant, on the request of applicants, waste lands on an emphyteutic lease (*erfpacht*) for a term not exceeding 75 years, against an annual quit-rent (*canon*) of 1 guilder per 7,096 square meters).

The application must be accompanied by a certificate of measurement of the lands selected.

The lands granted on an emphyteutic lease are subject to a ground tax amounting to three-fourths per cent. of their estimated value.

No quit-rent or ground tax is levied in the year in which the grounds have been acquired, and in the five ensuing years.

For every workingman employed on the establishment in the service of the tenant by emphyteusis, a capitation tax (*hoofdgeld*) of 21 guilders.

None but residents (*inwoners*)

THE YANGTZE-KIANG RIVER.

In the provinces governed by indigenous or native princes under the sovereignty of the Netherlands (Siak, Serdang, Deli, Langkat, &c.), belonging to the residency of the east coast of Sumatra, lands for agricultural enterprises are granted by those princes.

The grants conferred by them, based on a temporary cession of the soil against payment of an annual rental or indemnity, are subject to the approval of the Indian government.

The above information, whilst it is entirely authentic as far as it goes, may not be sufficiently detailed and comprehensive to serve the practical purposes of parties in the United States who may have the intention to become interested in the cultivation of tobacco in Sumatra.

If there are any such, it would seem to me to be advisable, if not necessary, for them to apply for further and fuller particulars on the subject, through agents or representatives in the colonies, to the proper authorities there.

In conclusion I deem it interesting to be stated that the two principal companies in Holland engaged in the culture of tobacco in Sumatra, one having its head office at Amsterdam and named the "*Deli-Maatschappy*," and the other at Rotterdam, named the "*Tabak Maatschappy Arendsborg*," have within the last two weeks declared dividends, arising from last year's sales of the crop of 1885, amounting, respectively, those of the former to 108½ per cent., and those of the latter to 100 per cent.

D. ECKSTEIN,
Consul.

UNITED STATES CONSULATE,
Amsterdam, April 6, 1887.

THE YANGTZE-KIANG RIVER.

REPORT OF CONSUL JONES.

I have conversed with Consul-General Kennedy touching an examination of the Upper Yangtze River, in order to study the capabilities of that region for the extension of trade. I also, at the instance of the consul-general, conversed with several of the leading American merchants of Shanghai, who naturally desire additional markets and the promotion and development of trade in the interior.

At Chinkiang I met an intelligent and observant missionary who has visited the Upper Yangtze, and has established a mission at Chunking, a populous city 400 miles above the rapids. It appears that merchants are not permitted to reside at Chunking, or to open establishments or warehouses, so long as steamers have no access to the port. But when steamers have succeeded in ascending the river so far, arrangements can be made to open Chunking to trade. The explanation of this is, that just beyond Ichang, which is 360 miles above Hankow, the river runs through a series of mighty gorges and forms rapids, the possibility of navigating which by foreign-built steamers has never been

more to the sea. On its banks are innumerable villages, towns, and cities, which are the outlets to populous regions in the interior.

All this upper river country is described as being very beautiful, of great fertility and capacity for trade, and is perhaps the most populous portion of China.

To give an idea of the vast number of inhabitants, I may mention that this province of Kiang-su has a population of 60,000,000 of people.

It will afford me great satisfaction if I can contribute in any way to the development of American trade in China.

ALEXANDER C. JONES,
Consul.

UNITED STATES CONSULATE,
Chinkiang, China, March 22, 1887.

LEPROSY IN SOUTH AFRICA.

REPORT OF CONSUL SILER.

I have recently read in American papers accounts of the existence of leprosy on the Pacific coast with expressions of fear that the disease may become widespread. This fear is but natural, coming from a country whose inhabitants have heretofore enjoyed immunity from a disease certainly the most loathsome and most to be dreaded to which humanity is heir. A few facts, therefore, pertaining to the disease in South Africa, where it is widespread and apparently increasing, may be of interest at this time.

The date of the first appearance of leprosy in Cape Colony is uncertain, but authenticated cases are mentioned in the old Dutch records upwards of one hundred years ago. The Dutch, at the time the colony passed to Great Britain, were slaveholders and introduced a large number of Malay slaves. Those slaves were obtained from the Malay Archipelago and adjacent islands. Their descendants are very numerous in the colony, Cape Town alone containing 15,000, or one-third of the population. The Malays and their descendants are more subject to leprosy than any other class of inhabitants here, and it seems highly probable that the disease was first introduced in the colony by Malay slaves.

Not until 1845 was any attempt made by government to check or to stamp out the disease. In that year a leper asylum was established at Robben Island, 7 miles from Cape Town, and up to 1884 744 lepers had been admitted to the institution, and comprised but a very small proportion of the leper population, as the segregation of lepers was not made compulsory. In fact, lepers mingle freely with the other citizens, and their appearance is so common that they attract little attention in the streets. At the Cape Town fish market I have seen lepers at work cleaning and curing fish, and the disgusting sight did not seem to deter buyers.

The rapid increase of the disease, particularly among the European population, as described in the recent reports of district commissioners, has aroused the colonial government.

LEPROSY IN SOUTH AFRICA.

CAUSE OF THE DISEASE.

The primary cause of leprosy has never been determined. It is questionable whether it rises spontaneously. But where there are germs of the disease its spreading is undoubtedly facilitated in great part by dirty living, unwholesome feeding, and loose habits. Exclusive fish diet is dangerous; and the fact is noteworthy that the disease is particularly virulent among the fishing population. One physician who has given much study to the subject attributes to the use of bad fish most of the disease in this colony, though this opinion is not shared in by the majority of authorities. Indeed there are practitioners who deny the fish theory altogether, and point for their support to the fact that leprosy flourishes in countries where fish is rarely eaten.

ITS CONTAGIOUS AND HEREDITARY CHARACTER.

That the disease is hereditary no doubt seems to exist; and that it is contagious is generally admitted by medical practitioners of this country—a small minority even holding it to be infectious. Recent microscopic investigation has established the fact that the diseased tissues and secretions are invaded by numerous parasitical organisms called *bacilli*. This specific bacillus of leprosy is no doubt the true cause, and it is spread by inoculation, either by direct contact with the secretion or suppurating sores of the leper, or transmitted by the clothes, utensils, pipes, &c., containing these parasitical germs of the disease. To touch a leprosy person with a sore finger, use the same knife or fork, or to drink out of the same glass, may be the means of communicating the disease. But the same law holds good with leprosy as with other contagious diseases; much depending on individual constitution. Impaired nutrition from insufficient or impure food, unclean habits, exclusive fish diet doubtless predisposes to the invasion of the bacilli, which in a healthy, vigorous constitution would find no admission. While many instances may be pointed out here where men cohabited with leprosy wives without contracting the contagion, well authenticated cases are vouched for at the asylum in which the disease was communicated by playing on a flute previously used by a leper, sleeping in a bed previously occupied by a leper, baiting a leper fisherman's hook, &c.

SYMPTOMS.

Dr. Atherstone, an eminent physician and member of parliament, who has made leprosy a special study for over thirty years, has kindly furnished me with the following memorandum describing the symptoms of leprosy as found in Cape Colony:

There are two distinct forms in this colony, namely, the anæsthetic and the tubercular, but I believe they are both the same specific disease. In the anæsthetic the fingers or toes are first affected—altered sensibility, either a burning sensation or the minute peripheral nerves of the skin being affected. In the tubercular the disease is first manifested by the formation of nodules, which are quite insensitive; and the tubercles are afterwards covered by a crust, which is often dropped off.

with both hands and feet off. One of the worst cases pointed out to me was that of a man with none of his face left, with the exception of a portion of the lower jaw and forehead, the nose, eyes, tongue, and cheek-bones having disappeared. He was only living because the vital organs had been unmercifully unimpaired. It has been my lot to witness much human misery and distress incident to war and contagious epidemics, but I have seen nothing, nor do I believe it possible for the mind to conceive anything, so terrible and abhorrent as the awful picture presented by a congregation of lepers.

TREATMENT.

The disease is considered incurable. The patients who arrive at Robben Island are, as a rule, found to have been badly fed. After admission they get comforts—warmth, good food, and proper clothing—and then the disease becomes stationary for a time, and makes but little progress for a considerable time thereafter. A liberal supply of fatty food tends to keep the disease in check. Carbolic oil, used externally, cod-liver oil, and tincture of blue-gum (Australian Eucalyptus), internally, have been efficacious in staying the inroads of the disease. But after all, these and all other remedies only tend to prolong the disease, for once affected with the leprous taint the victim is doomed to slowly, but surely, rot away until mercifully relieved by death.

PREVENTIVE MEASURES.

Colonial experts agree that the spread of the disease can be prevented, and that it can be stamped out by stringent repressive measures, looking to the segregation of lepers. The result of a parliamentary inquiry held in 1883 was the following unanimous recommendation :

That it has been conclusively proved to your committee, that by proper measures, energetically and efficiently carried out, it is possible to arrest the further progress of the disease, and ultimately to stamp it out altogether. That for the accomplishment of this object an act for the compulsory segregation of all lepers is necessary, and the establishment of leper institutions in suitable localities where perfect isolation can be secured.

It might be added that the segregation of lepers would avail but little in stamping out the disease, unless the sexes were strictly kept apart, for it is conclusively shown that the disease does not impair the procreative powers, but that, on the contrary, lepers, especially the females, are peculiarly libidinous.

LEPROUS ANIMALS.

The remarkable fact that leprosy is communicable to animals has been observed at Robben Island Asylum, and is vouched for by unimpeachable authority. Pigeons shot near the leper wards have been found with unmistakable symptoms of leprosy ; mice have been caught in the leper wards, presenting the usual characteristic symptoms of leprosy. Twelve pheasants sent to the resident surgeon for breeding purposes died in eight months.

be communicable to human beings through the agency of animals suffering from the disease being used as food.

CONCLUSION.

The disease presents such strange physiological idiosyncrasies that it is not to be wondered at that medical experts widely disagree on the question of cause and contagious character. A case with which I am well acquainted will illustrate its seemingly mysterious power of propagation. In one of the oldest and wealthiest Dutch families in this colony the mother is a confirmed leper, of the type described as "tubercular," by Dr. Atherstone, before alluded to. The father and a large family of strong, healthy, grown up sons and daughters show not the slightest taint. I have several times enjoyed the hospitality of this family and availed myself of the opportunity thus afforded of inquiring into this melancholy case with the view of a possible solution. I am assured that neither on the side of the father or mother a case of leprosy had ever occurred in their families, and they are able to trace their genealogy back at least one hundred years. But I ascertained the fact that the husband and wife were first cousins, and that their families had intermarried for several generations. It is just possible, therefore, that the well-known tendency which the intermarriage of blood relations has, *i. e.*, to lower the physical standard, made the wife's constitution predisposed to readily receive the germs of leprosy. But as she is positive in her assertion that she never in any manner came in contact with a leper, the manner in which the bacillus of leprosy was communicated to her must remain an impenetrable mystery.

After sifting the mass of conflicting evidence on the subject, it is safe to lay down the following general axioms applicable to leprosy:

- (1) Leprosy is contagious.
- (2) Insufficient or bad food (particularly bad fish, or exclusive fish diet), unclean habits and a consequent low constitution, predispose to the disease.
- (3) Healthy and vigorous persons, unless they place themselves in reckless contact with lepers, enjoy comparative immunity.

JAS. W. SILER,
Consul.

UNITED STATES CONSULATE,
Cape Town, March 24, 1887.

TROPICAL FRUITS OF VENEZUELA.

REPORT OF CONSULAR AGENT RÖMBERG.

... of Cariaco, about 35 miles

is under cultivation, all of which is devoted to cocoanuts and sugarcane, though all these lands could be easily utilized for the cultivation of every kind of tropical fruits and vegetables.

The valley of the Manzanares River, extending from the gulf to the village of San Juan, a distance of 12 miles, is spacious and fertile, and is also well adapted to the raising of all kinds of tropical fruits.

The dry season lasts from January to June; the rainy season extends through the rest of the year. On the gulf coasts, the dry season is generally healthy, but during the rainy period frequent cases of malarial fever occur. This malady is rarely fatal, however, and readily yields to quinine treatment. Along the Manzanares River it is uniformly healthy.

The pineapples and grapes of this section are famed for their size and flavor, and, with proper means for export, might be raised in immense quantities. Lands suited to the purpose lie only a short distance in the interior, and are reached by easy roads from this port.

The unsurpassed excellence of the fruits of this section and the facility for their cultivation can be easily demonstrated; so, with the investment of a small capital and the inauguration of quick transportation, a fruit trade of any desired proportions might be readily established. Lands are held at nominal figures and may be obtained on very easy terms. Natives can be hired at 50 cents per day, or at a monthly rate. Farming on shares is also practiced to some extent. There are no export duties levied on fruits, as is the case with other products, and port charges are reasonable.

Much foreign capital is seeking investment in Venezuela, and is being invested in railroads and other costly enterprises. If it be true that the tropical fruit trade is profitable in the United States, and means for speedy transportation from this coast can be cheaply devised, then it is safe to say that this is the place for the business, and that those who embark in it will, from small outlays, reap satisfactory returns.

JOSÉ G. NUÑEZ ROMBERG,
Consular Agent.

UNITED STATES CONSULAR AGENCY,
Cumana, Venezuela, April 4, 1887.

MEXICAN RAILWAY AND TARIFF.

REPORT OF CONSUL ALLEN.

The opportune moment for commercial exploitation of Mexico on the part of the American merchant and manufacturer is near at hand. This opinion is based upon the following facts: First, the extension of the Mexican International Railway, and, second, the revised tariff list, as enacted by the last Mexican Congress, and which goes into effect the 1st day of July next.

Central at Laredo, some 300 miles distant, and ultimately terminate at one of the Gulf or Pacific coast ports of Mexico. It passes through a section of country in the past having but limited commercial relations with the outside world, and where the methods of transportation employed were circuitous, expensive, and occupied much time. The general character of this country is favorable to the development of an extensive and lucrative commerce, containing, as it does, valleys rich and fertile, well populated, adapted to the cultivation of all cereals, and large tracts well wooded and watered. The celebrated Laguna district, one of the most productive valleys in Mexico, is tapped by this line. Its soil is peculiarly suited for the successful cultivation of cotton, being bountifully supplied with water by a natural system of seepage. Irrigation is unnecessary, and the absence of deteriorating influences, such as early and late frosts and heavy rains, enables the planter to harvest his entire crop absolutely free from stain or discoloration. In this district the Mexican cotton-planter, with his primitive methods of cultivation still in use, receives an average yield of 400 pounds of lint (or gin) cotton to the acre, while the average yield of the United States does not exceed 250 pounds; the cost of production to the former is $5\frac{1}{2}$ cents per pound, while that of the latter is from 6 to 8 cents, and the Mexican planter is protected from competition by an import tax of 6 cents per pound on all foreign-grown cottons. Fruits of all varieties are found in this region, and the wine-grape is grown with marked success; a just approximation of its fertility and resources can only be reached by a comparison with the sterility of the frontier.

THE REVISED TARIFF.

Under the operation of the revised import list duties are so largely reduced that many articles of American manufacture will be brought within the reach of the poorer classes, thus creating a demand which hitherto has not existed; especially will this be the case with canned goods and American prints; on the former the duty has been prohibitive, or nearly so; on the latter the reduction in duty is great. Thus the increasing and cheapening facilities for transportation, assisted by confidence and respect for our people, which is the outgrowth of a conviction rapidly becoming fixed in the Mexican mind that American citizenship is a guarantee that its possessor will be protected in every legal and just right, is breaking down all barriers to a full and complete establishment of trade relations on a sure and lasting basis. Spasmodic efforts in this direction will accomplish no permanent good. The American merchant must realize that action, persistent and earnest, is necessary, and to my mind the most efficacious method to be adopted is that of sending active, earnest, and intelligent representatives to the Mexican market. In the large area now opening up, the American should take the initiative; for sometime to come he would not be brought into sharp competition with the merchants of the Old World, whose un-

amount levied, since reduced by gubernatorial action to 3 per cent., and the fear that new laws of a like nature may at any time be passed rests as an incubus on the development of trade.

W. G. ALLEN,
Consul.

UNITED STATES CONSULATE,
Piedras Negras, April 7, 1887.

TRADE AT PORT STANLEY.

REPORT OF CONSUL FRANCOIS.

The most noticeable feature in the exports from this consulate to the United States during the last six months has been the amount of eggs and green apples, the former valued at \$84,047.37, and the latter at \$26,002.25, with \$7,780 of dried apples, making \$33,782.25. The eggs were invoiced at 10 and 12½ cents per dozen; the apples, early part of the season, at 80 cents and \$1 per barrel, including the barrel.

The eggs are collected in the country by itinerants, in exchange for goods or money, at 6 to 8 cents per dozen, and taken to establishments erected for the purpose, where they are put through some process which it is said will keep them good for six months or a year, packed in barrels, and shipped.

The apple crop throughout this section was in excess of that of any season for a number of years, and their scarcity in the States bordering the boundary line made them in great demand. Some fears are expressed as to the continuance of this (section) being a good apple-producing country, as it has been noticed the fruit has been growing less perfect and smaller every year, being stained with black spots, penetrating the fruit, and making that of some orchards and of some varieties almost unsalable. It is learned that not many years since plums and all varieties of cherries were produced in this part of Ontario in perfection, but a disease called the "black knot" destroyed nearly all the trees, and it is now said is attacking the apple and pear trees.

The demand for Canadian barley in the States is on the increase (said to be on account of its superior quality), and the crop of last season in many instances was bargained for in advance of being harvested.

The value of barley shipped to the States during the past six months ran up to \$111,447.40. Prices ranged from 35 to 37½ cents per bushel.

Within the last three or four months parties from the States have been in this section purchasing horses, succeeding to their satisfaction, and shipping thereto 149 head, valued at \$23,913, prices ranging from \$75 to \$250. Notice has been given that agents from England will shortly arrive, looking for horses for the English cavalry, in view of which and the approaching farming season, the price of good horses has advanced.

Other than a shipment of unhackled flax, of the value of \$2,380, no new product is noticed among the exports to the States.

The value of declared exports

TRADE AT PORT STANLEY.

machine-shops, a white-bronze monument establishment, a feather-bone factory, three planing-mills, and one brewery. The large establishment for manufacturing farming implements has been closed for more than a year. Saint Thomas and neighboring towns are offering bonuses in the way of money, free water, and exemption from taxation for a term of years as an inducement for manufacturers to locate therein.

* * * * *

The number of emigrants to the United States applying to this consulate for certificates as to personal effects during the last six months was 189, of which 62 were heads of families.

ALLEN FRANCIS,
Consul.

UNITED STATES CONSULATE,
Port Stanley and Saint Thomas, Ontario, April 11, 1887.

NOTES.

Foreign dentists in Germany.—Consul-General Raine writes from Berlin, April 9, 1887:

I transmit a translation of the following order, just issued by the president of the police board of Berlin, Mr. v. Richthofen:

"Whereas the royal privy court (*Kammergericht*) by several of its decisions has established it as a principle that only such persons can assume the title of dentist, no matter whether they state 'that they have received a diploma in other countries' or 'have not received a diploma in Germany,' who have previously secured a certificate of qualification from the board of examiners of the German Empire; and whereas the same court has finally decided that the designation of 'American dentist' in connection with the title of doctor is a violation of section 147, No. 3, of the imperial trade law, because such title, resembling that of a regularly approved physician, may lead to the belief that persons assuming the same have been properly approved and examined as medical practitioners in this country: therefore I require of all persons concerned to abstain hereafter from using such designation publicly on signs, cards, in newspapers, and other advertisements, &c., and to remove within three months from their houses, offices, and dwellings all signs of such description, otherwise they must expect that they will be subjected to penalties and other police measures to cause compliance with this order."

Similar orders have been published in other cities of Germany.

Domestic exports, Hawaiian Islands, first quarter 1887 compared with first quarter 1886.

American lard in Italy.—Consul Sartori writes from Leghorn: "I have just and reported on a revision of the Italian tariff list, and will be largely increased for the lard."

American lard in Italy.—Consul Sartori writes from Legation, Rome, that a commission has sat and reported on a revision of the Italian tariff list, and, generally speaking, the duties on imports will be largely increased for the purpose of protecting Italian industries and products. Dr. Gardini, the consular agent at Bologna, reports that a strong effort has been made there to have a duty of 20 lire per 100 kilograms (\$3.86 per 220 pounds) imposed on American lard. They publish a letter in which it is stated that by a recent analysis American lard contains 12 to 15 per cent. of water, hidden by means of 2 to 3 per cent. of alum and 1 per cent. of *calce caustica*.

Present state of the wool trade.—Consul Williams writes from Rouen, under date April 20, 1887:

The first fifteen days of April have proved favorable to retail dealers in woollen goods, especially those engaged in making up garments, but the activity among the manufacturers has declined; nevertheless the demand for standard goods of plain cloth still continues.

The first fifteen months of the year, 1897, the demand for goods, especially those engaged in manufacturing, has declined; nevertheless the demand for cloth still continues.

At Fourmies, combed wool and yarn have held their own with difficulty. Numbers 120 and upwards have declined 25 centimes (5 cents) per kilogram since last month. Soft and clinging fabrics are entirely neglected. It is true that the season for merinos is drawing to a close, and that there is an occasional demand, such as takes place every year at this time, which gives a momentary revival to the market.

At Roulaix, Tourcoing, and Rheims, the orders are not sufficient to supply the factories, and have been taken at prices which are not remunerative, owing to the price of raw material.

During the month of last March, Mazamet sent off 59,994 kilograms of cloth, and 499,112 kilograms of worsted goods. During the corresponding month of last year, Mazamet sent off 59,994 kilograms of cloth, and 499,112 kilograms of worsted goods.

20 and upwards have been entirely neglected. Soft and clinging fabrics are entirely neglected. The market is drawing to a close, and that there is an occasional demand, such as year at this time, which gives a momentary revival to the market.

At Roulaix, Tourcoing, and Rheims, the orders are not sufficient to supply the factories, and have been taken at prices which are not remunerative, owing to the price of raw material.

During the month of last March, Mazamet sent off 59,994 kilograms of cloth, and 708,859 kilograms of worsted goods. During the corresponding month of last year shipments were 64,684 kilograms of cloth and 499,112 kilograms of worsted goods.

of France, in wool and its products, during the two preceding months of the preceding

The German trade is quiet, in spite of the strenuous efforts put forth by manufacturers to dispose of their goods. It is estimated that Germany has sent 3,000,000 marks worth of cloth to Turkey.

The outlook of the Polish market is not bright, on account of the weakness of the wool market. Russian manufacturers are in a still worse condition.

The state of the woolen industry of Spain is almost desperate. In the principal centers of manufacture the greater part of the machinery is idle, and there appears to be no prospect of improvement in the near or distant future. Numerous failures have taken place there, and many more must follow.

Exports from Austria-Hungary.—Consul-General Edmund Jussen, under date of April 14, 1887, submits the following statement showing the value of declared exports from the consular districts of Austria-Hungary (agencies included) to the United States of America, during the quarter ending March 31, 1887:

Falsification and coloring of French wines.—Consul Roosevelt transmits translations of articles which appeared in the newspapers *La Gironde* and *La Gironde Vinicole*, of Bordeaux, relative to the falsification and coloring of wines:

[From *La Gironde* of December 23, 1886.]

“Condemnation of wine merchants, December 20, 1886.”

“Mr. Dufieux, a wine merchant at Romanèche Thorins, has been fined 500 francs and condemned to four days’ imprisonment for falsifying wine by the aid of Bordeaux red.

“Mr. Hantz, manager for Widow Thomas, of Béziers, has been condemned to pay 500 francs for falsifying wines and ordered to insert in four newspapers the notice of the seizure and confiscation. The Widow Thomas was declared civilly responsible.”

[From *La Gironde* of March 20, 1887.]

Tribunal Correctional of Bordeaux.—Artificially colored wines.

“On the 21st of January, 1887, Mr. Balade, wine merchant at Bégles, sold by auction, and through the medium of the registrar, wine produced on his estate in 1884 and 1885. Several days after the sale purchasers complained to the tribunal that the wine bought by them had been falsified. An examination was ordered. Mr. Babileé, pharmacist, and Mr. Robineau, expert chemist, proceeded to examine the wines sold and those yet in the possession of Mr. Balade. All were colored by sulfofuchsine. In searching the house of Mr. Balade there were found six barrels of coloring matter and a voluminous correspondence exchanged between him and manufacturers (as many French as foreign) of coloring matter. Piquant details: M. le Commissaire of Bégles proved the transfer of coloring matter from the depot to the residence of Mr. Balade by traces left on the road. Prosecuted by these facts, Mr. Balade was condemned to fifteen months’ imprisonment. Yesterday he appealed against the sentence. The tribunal condemned him to ten months’ imprisonment, to the posting of the judgment on the door of his residence and wine cellar, and the insertion of the sentence in the newspapers *La Gironde*, *La Petite-Gironde*, *Le Bordeaux*, *La Victoire*, and *Le Nouvelliste*, and ordered the destruction of the wine seized.”

[From *La Gironde Vinicole* of April 1, 1887.]

“Sorrel and the wine merchants.”

“The tribunal correctional of Béziers Herault has just condemned twenty-six wine merchants of Bédarieux to pay fines for falsifying wines and for deception in the merchandise sold. The coloring matter used to give a red color to the alcoholized water sold for wine was sorrel (*Recella tinctoria*).”

It will be seen by the above translations that the French authorities deal rigorously with persons falsifying wines for home consumption, but little, if any, attention is given to wine manufactured for export. Large quantities of Spanish, Italian, and Portugal wines are yearly imported into the department of the Gironde by French wine merchants, who doctor and fortify them in such manner that they are given the color and flavor of genuine Bordeaux, and are placed upon the market as such. The skillful manner in which wines are manufactured and falsified deceive any but a professional wine-taster. If bureaux of analysis were established at such ports of entry as New York, Boston, Philadelphia, New Orleans, and San Francisco, and all wines found containing foreign or noxious matter returned to the country from whence exported, it would compel exporters to ship only pure and wholesome wines to the United States.

In the city of Bordeaux there are one thousand three hundred and seventy-five wine dealers, among which number I can confidently recommend to our public the reliable houses of Barton & Guestier, Nathaniel Johnston & Sons, Cruse fils frères, Boshamer Léon & Cie., Jules Merman & Cie., Dubos frères, Evariste Dupont & Cie., John B. Avérons (Panillac), Eschenauer & Cie., A. Lalande & Cie., Videau fils, Gabriel Sefoupe, F. Robert Schmidt & Cie., Lestapie & Cie., Joseph Cuzol et fils et Cie., H. Toursier & C. L. Bertrin, and J. L. P. Lebègue & Cie. (Contenac).

There is abundant expert testimony to the fact that as good wines are made in California as in France. Last year white and red California claret, and

perience, exceeding care, and technical skill employed, and not, as is claimed by the French, to superior advantages of soil and climate. The wine industry in the United States has, owing to wide latitude, as is evidenced by the pure and agreeable wines produced in Virginia, as well as in California, a brilliant future. In view of this fact, there is no reason to doubt that in time there will be brands of our native wines as famous and as much in demand as those of the most celebrated vineyard of France.

Receipts of the Belgian Government.—Consul John H. Steuart, of Antwerp, writes as follows under date of April 21, 1887:

From official figures just published I have been enabled to extract, and to submit herewith, the following statistics and interesting information regarding the state railway, post-office, telegraph, and marine receipts of the Belgian Government during the years 1885 and 1886, as also during the months of December, 1885 and 1886:

Railways.—The net receipts during the year 1886 amounted to 112,615,238 francs, against 115,748,434 francs the preceding year, showing a decrease for 1886 of 3,133,196 francs, or 2½ per cent. The great difference between the receipts of 1885 and 1886 is attributable to the International Exposition that was open at Antwerp from May to October, 1885, and drew an immense number of visitors.

When comparisons between the months of December, 1886, and 1885, are made, after the closing of the exposition, a large difference is shown, in proportion, in favor of the year 1886, the receipts having been 10,059,765 francs against 9,444,155 francs in December, 1885, showing an increase for December, 1886, of 615,610 francs, or 6½ per cent.

The receipts, as stated, in the above-named months of December, 1886 and 1885, were derived, according to the nature of the subject or article conveyed, as follows: Passengers, 2,627,857 francs in December, 1886, against 2,565,127 francs during the same month of 1885; baggage, 52,706 francs, against 51,058 francs; parcels and small boxes of merchandise, 708,082 francs, against 747,159 francs; large merchandise, 5,491,855 francs, against 5,074,250 francs; cash or bullion, 21,433 francs, against 20,307 francs; carriages, 2,978 francs, against 5,339 francs; horses and cattle, 97,906 francs, against 92,279 francs, and other products, 1,056,948 francs in December, 1886, against 915,643 francs during the same month of 1885.

The average per day and per kilometer amounted to 103.8 francs in December, 1886, against 96.06 francs in December, 1885.

Post-offices.—The post-office receipts of the state during the year 1886 aggregated 14,800,982 francs, against 14,399,980 francs the preceding year, showing a difference in favor of 1886 of 401,002 francs, or nearly 3 per cent. During the month of December, 1886, the receipts were 1,524,317 francs, against 1,435,265 francs during the corresponding period of the preceding year, showing an increase for 1886 of 89,052 francs, or over 6 per cent.

The following is a synopsis of the business effected for account of third parties: Commercial bills were collected to the amount of 31,336,870 francs in December, 1886, against 28,885,891 francs for the same month of 1885; post-office orders, 8,871,868 francs, against 8,752,816 francs; receipts and acquittances collected, 5,583,912 francs, against 5,055,190 francs; savings-fund receipts, 5,155,580 francs, against 4,464,558 francs; subscriptions to newspapers and journals collected, 1,471,266 francs, against 1,505,882 francs; "bons de poste" collected, 588,496 francs, against 514,780 francs; coupons collected, 49,407 francs, against 48,224 francs in December, 1885.

By the above figures it is shown that there was a general increase for December, 1886, in all branches of post-office business.

Telegraph offices.—The receipts of the telegraph offices aggregated 2,868,546 francs during the year 1886, against 2,774,278 francs the year previous, showing an increase for 1886 of 94,268 francs, or 3¼ per cent.

The net receipts during the month of December, 1886, amounted to 233,716 francs, against 209,107 francs during the same month of the preceding year, showing a gain for December, 1886, of 24,609 francs, or nearly 12 per cent.

Of the amount thus collected, 108,817 francs was received for 189,538 telegrams destined for the interior of the Kingdom, 92,912 francs for 126,566 telegrams sent to countries, and 19,315 francs for 40,344 telegrams sent in transit through Belgium, 105,456

passenger service between Ostend and Dover, taxes on pilotage and towage, light-house tax, maritime-police tax, and the ferry receipts across the Scheldt at Antwerp.

During the month of December, 1886, there were received from the above-named sources 300,407 francs, against 289,079 francs during the corresponding period of 1885, showing an increase for 1886 of 11,328 francs, or nearly 4 per cent.

The receipts in December, 1886, from the different sources, compare with the corresponding period of 1885 as follows: From the mail and passenger service between Ostend and Dover were collected 30,378 francs in December, 1886, against 26,488 francs during the corresponding month of 1885. The taxes upon pilotage and towage amounted to 186,148 francs, against 181,670 francs; the light-house taxes to 73,403 francs, against 70,017 francs; the maritime-police taxes to 8,159 francs, against 8,698 francs, and the ferry receipts across the Scheldt at Antwerp to 2,319 francs in December, 1886, against 2,206 francs in December, 1885. It is hereby shown that an increase for 1886 has been marked in every item but one, the maritime-police taxes, where a slight decline for last December is shown.

Argentine harvest of 1887.—Consul E. L. Baker, of Buenos Ayres, writes as follows, under date of March 31, 1887:

From all parts of the Argentine Republic the reports in reference to the crops are of the most promising nature. The harvest is now nearly complete, and it is pronounced by those who are engaged in the grain trade to be, by all odds, the largest and most satisfactory crop that was ever produced in the country. Not only has there this year been a much larger breadth of land put down in cereals, but, owing to the exceptionally fine season and the absence of locusts, it has generally been saved in excellent condition. I was making inquiries in regard to the estimated yield, but I find in the Buenos Ayres Standard of this morning the following article, prepared by Mr. M. G. Mulhall, the well-known statistician, and give it as a very fair exhibit; but I think his figures are rather under than above the general opinion on the subject:

“Although all the crops are not yet gathered, we can arrive at a pretty close estimate of their quantity and value. The total area under tillage in 1884 was 650 square leagues, and is at present about 800 square leagues, that is, five and a quarter million acres, or 1,250,000 cuadras. According to the latest information that we possess, the agricultural area is distributed more or less in the following manner:

Provinces.	Cuadras.		
	Wheat.	Other crops.	Total.
Buenos Ayres.....	180,000	275,000	455,000
Santa Fé.....	220,000	190,000	410,000
Mendoza.....	10,000	80,000	90,000
San Juan.....	10,000	44,000	54,000
Entre Rios.....	15,000	45,000	60,000
Tucuman.....	9,000	33,000	42,000
Cordoba.....	17,000	15,000	32,000
Various.....	42,000	68,000	110,000
	503,000	750,000	1,253,000

“The value of the crops in 1884 was estimated at fifty-seven millions of hard dollars, and at present reaches something close on \$70,000,000, computed not in depreciated paper money, but in gold, that is, about £14,000,000, as compared with £24,000,000 produced annually by pastoral industry.

“Wheat is a very good crop in the irrigated lands of Mendoza and San Juan, where a cuadra produces 3 tons, say 30 bushels to the acre; but in Buenos Ayres and Santa Fé the yield is less than 1 ton per cuadra. Although the crop this year has been larger than usual, we do not think it will exceed 500,000 tons, or 20,000,000 bushels, and as our consumption averages 3 bushels per inhabitant, we shall have a surplus of 10,000,000 bushels for exportation, worth (at last year's prices in Liverpool) six million hard dollars.

“Maize covers an area of 240,000 cuadras, yielding about 2 tons per cuadra. Maize export averages 210,000 tons yearly, and maize is the principal export of the country.

NOTES.

"Tobacco has an area of 3,000 cuadras, and the crop usually approaches 8,000 tons, worth not much over \$1,000,000, the province of Corrientes yielding more than half the entire crop.

"Wine, in good years, amounts to close on 6,000,000 gallons, the product of 16,000 cuadras, and its value on the place of vintage reaches \$1,500,000.

"Alfalfa, or more correctly alfa, covers an area variously estimated from 360,000 to 400,000 cuadras; the crop averages 2,500,000 tons, worth about \$25,000,000. The quantity exported as hay rarely exceeds 15,000 tons per annum, worth \$200,000.

"Fruit, vegetables, &c., cannot be estimated with any precision, but cover at least 50,000 cuadras, producing a yearly value of \$5,000,000 or upwards.

"Summing up the foregoing crops, we find the gross value produced and the amount exported stand as follows:

Crops.	Total crop.	Export.
Wheat.....	\$12,000,000	\$6,000,000
Maize.....	8,000,000	4,000,000
Linseed.....	2,000,000	2,000,000
Sugar.....	3,000,000	
Tobacco.....	1,200,000	
Wine.....	6,000,000	200,000
Alfa.....	25,000,000	
Fruit, &c.....	5,000,000	
Total.....	62,200,000	12,200,000

"In the above table it must be observed that wheat is put down at the low estimate of twenty-four gold dollars per ton, and the other values are no less moderate. It may therefore be assumed that our crops this year will reach a value little short of \$70,000,000. In our Hand-book of 1885 we showed that the capital in tillage in the Republic reaches \$230,000,000. The crops, therefore, represent a gross return of 30 per cent on capital. The agricultural (non-pastoral) population comprises between 85,000 and 90,000 families, whose labors represent a product averaging \$800 per annum for each family."

A well-known grain broker, who keeps himself well posted and to whom I submitted the foregoing articles, thinks that Mr. Mulhall is much below the actual figures in his estimate of both wheat and maize. He thinks that, after meeting all home requirements, there will be a surplus of quite 15,000,000 of bushels of wheat for exportation, and of fully 500,000 tons of maize or Indian corn. Indeed, he says, from the information he has received, he puts down the maize crop at more than double what it ever was before.

The question whether it will pay, at present rates abroad, to ship the surplus of wheat and maize to European markets, would seem to be settled in the affirmative, from the fact that already several cargoes have gone forward from Rosario, and a large amount of additional tonnage is under grain charter for the English Channel.

The quotations of wheat yesterday in this market were from \$3.50 to \$.550 paper per 100 kilograms, equal to from \$2.50 to \$4 gold. The price of Indian corn was \$2.80 paper per 108 kilograms, equal to \$2 gold; but these prices will soon be lower.

CONSULAR REPORTS
ON
COMMERCE, MANUFACTURES, ETC.

No. 80--JUNE, 1887,

The reports contained in this number have been selected from the annual reports of the consular service prepared for publication in the volumes known as "Commercial Relations." As the edition of these volumes is comparatively small and unequal to the demand, the more important and interesting matters they contain are comprised in this issue of the Consular Reports, and published in advance of the Commercial Relations. As rapidly as new numbers can be made up subsequent issues will be printed, including the more important reports from the rest of Europe, Asia, Mexico, Central America, South America, and Australia.

AUSTRIA-HUNGARY.

Report of Consul-General Jussen on the commerce, industries, &c., of Austria-Hungary.

TRADE REVIVAL.

Although the United States of America and its commercial progress are hardly ever discussed in the Austrian press during the year, they are quite sure of honorable mention when the first day of a new year makes its appearance and when the national economists feel called upon to make up the balance-sheet and to compare the condition of their own people with that of the Western Republic.

For the last six months of 1886 the business of this Empire has materially improved, and although the admission is made somewhat reluctantly, still it is made, and Austrian journalists confess that the first impulse and cause for this improvement arose in the United States, and that the increase of exports from Austria and the consequent benefit to the industries of the Empire were a direct reflection of the trade beyond the Atlantic.

But in spite of this decided increase of trade, and in spite of the revived hope of manufacturers and exporters, there is a deep-seated want of confidence in future commercial prosperity. If peace could be assured then all might take hope and better times might reasonably be expected; but if the Bulgarian complications should finally culminate in a war with Russia, the injury to Austrian-Hungarian industrial and mercantile interests will be simply incalculable. And in the face of Bismarck's peaceful assurances, careful business men here seem to believe that the clash of arms in the coming spring is unavoidable. The burden of such a war, its sacrifices and misfortunes, will fall heaviest upon Austria. Even if England and Italy should be drawn into the contest, the Austrian-Hungarian monarchy would of necessity carry the greatest weight of the conflict, and whether victorious or not, the result would, at least in an industrial and commercial direction, be equally ruinous.

The theater of action would in all probability soon be transferred from Bulgarian to Austrian soil, and even before the first battle was fought the manufacturers of the country and all those ramifications of business which follow in their train would receive an almost fatal blow. The moment that the army of Austria-Hungary is placed upon a war footing and the reserve is called to arms, the factories and offices and business houses will be depopulated; and if the demand for Austrian manufactures continued it could not be supplied, for the skilled laborer would be handling a musket instead of turning a tool. Only men above forty years of age would be left at home, insufficient in number, strength, and skill to fill the great void created by the war.

The credit of the Austrian importer would certainly suffer to the same extent to which the business of the exporter would be reduced, because the home demand for all imported commodities would suddenly cease, and in all probability collections of outstanding accounts would be more problematical than in times of peace. Add to this the unavoidable necessity of increased taxation for the purpose of paying the expenses of war, the increased costs of the necessaries of life, the sudden embargo which war would impose upon the fine arts and their development and culture, which are important factors in the life of an Austrian, and it would seem as if ample reason for apprehension were apparent, and confidence in industrial and commercial progress and improvement could not well be established until at least a brief peace is absolutely assured and the Oriental question settled, if only for a short series of years, for a final and conclusive settlement without war and its attendant sacrifices seems to be entirely out of the question.

The importation of American manufactures and products into Austria-Hungary is as yet inconsiderable, sole leather, agricultural machines, wheels, spokes, &c., and petroleum comprising the main articles of import. The exporters of these articles have undoubtedly safe and reliable connections, and it is, therefore, probably quite superfluous to suggest that they should study the political horizon and the ever-changing phases of the Oriental question quite as diligently as their market

eral chambers of commerce, recommending them to send young men to foreign centers of trade for the purpose of studying the business, habits, and condition of the people, and to prepare the ground for the establishment of factories and branch houses of Austrian firms. A fund has been started by the Academy of Commerce at Vienna, and thus far 153,000 florins have been collected to defray the traveling expenses of these students of the commerce of foreign lands. It has also been proposed to employ these pioneers of the Austrian export trade as representatives and salesmen of home manufacturing establishments, and thus to insure their support while they devote their time to the study of foreign commercial relations.

As I have already reported, the Export Society of Vienna has during the past year pushed with considerable vigor the establishment of sample depots of Austrian wares in foreign markets, and as a third means of encouraging the export trade a sample depot of foreign manufactures has been started in Vienna for the purpose mainly of informing Austrian manufacturers of the kind, character, price, &c., of goods in demand and used in foreign countries, so that when this depot or museum is complete an Austrian exporter or manufacturer need not travel to foreign climes in order to acquaint himself with the necessities or fashions of the people dwelling there, but can visit the museum, and there be informed minutely as to his chances of success, should he desire to furnish the wares in demand. He will see the kinds of goods required; can estimate their cost of manufacture at his factory to a fraction; and as he can also be informed of the price which they bear in the market in question, it would seem to be a simple mathematical calculation for him to decide whether to make the venture or not.

Aside from this he has other auxiliaries at hand to assist him in his efforts to extend his trade with the greatest possible safety. The Export Society of Vienna is in constant correspondence with merchants and with Austrian consuls in foreign countries, and, as I understand, is ready to impart the very valuable information thus gained to any Austrian merchant who may apply for it.

COMPETITION OF AUSTRIAN WITH AMERICAN EXPORT TRADE.

The export trade of Austria to markets where a competition with American exporters would be encountered is as yet very limited. Few Austrian manufactures find their way to the Central and South American states, or to Havana, China, or Japan, and these are mostly the same articles which Austria exports to the United States, viz: Vienna specialties and novelties, Bohemian and Vienna export beers, Hungarian wines and furniture. And none of these Austrian manufactures, it appears, are shipped directly, but by way of Hamburg and London, and enter the foreign markets under French and English labels, very much to the annoyance of Austrian manufacturers and consuls, who are clamoring for a direct communication. As to the articles of furniture, it is to be hoped the time will come when it will seem absurd and unprofitable to export chairs, bureaus, tables, looking-glasses, book-cases, etagères, &c., from Austria to the Havana and to the Central and South American states. Whenever we reach the conclusion that a reduction of the tariff on raw materials is in the interest of industrial interests

DUTIES ON RAW MATERIALS.

To mention only one or two examples showing the distinction between our tariff and that of Austria on raw materials required in the manufacture of furniture, I will state here that marble, raw and cut in blocks or slabs, is free of duty, and that all kinds of wood, raw or prepared, European or foreign, is also free of duty under the Austrian tariff, except veneers, upon which, if unpolished, a duty of 60 cents per 200 pounds is imposed; whereas, under the tariff of the United States, marble of all kinds in block, rough or squared, pays a duty of 65 cents per cubic foot veined, sawed, or otherwise, and in slabs \$1.10 per cubic foot. Cabinet wood, in logs, round, and as unmanufactured timber, not otherwise specified, is free; but black-walnut lumber pays duty as sawed lumber, and all manufactured wood not otherwise specified 20 per cent. ad valorem, and veneer produced by cutting pays 35 per cent. ad valorem.

AMERICAN WINES.

The question whether American wines will displace those of Hungary in the markets mentioned will, I have no doubt, be answered in the affirmative before many years have elapsed. California, Missouri, and Ohio clarets and white wines certainly need not fear competition with the lighter wines of Hungary, and the "Tokayer" brand will probably alone remain an inimitable and unapproachable specialty.

EXPORTS AND IMPORTS OF AUSTRIA-HUNGARY DURING 1886.

The official statistics showing the total of the export and import trade for 1886 has as yet not been published, and, as I know by last year's experience, will not be ready for publication until the end of March. I can therefore give exact figures as to the total amount only for the period from January to September, 1886. To facilitate comparison and to enable parties interested to judge of the fluctuations of trade for a series of years, I give the figures from 1877 to September, 1886.

Years.	Exports.	Imports.	Excess of exports.	Years.	Exports.	Imports.	Excess of exports.
	<i>Florins.</i>	<i>Florins.</i>	<i>Florins.</i>		<i>Florins.</i>	<i>Florins.</i>	<i>Florins.</i>
1877.....	666,600,600	555,300,000	111,300,000	1882.....	711,900,000	654,200,000	127,700,000
1878.....	654,700,000	552,100,000	102,600,000	1883.....	749,900,000	624,900,000	125,000,000
1879.....	684,000,000	556,600,000	127,400,000	1884.....	691,500,000	612,600,000	78,900,000
1880.....	676,000,000	613,500,000	62,500,000	1885.....	672,100,000	557,900,000	114,200,000
1881.....	731,500,000	641,800,000	89,700,000	1886*.....	526,700,000	411,900,000	114,800,000

* To September.

These figures show that the import reached the highest point in 1882, then, *i. e.*, up to 1886, it has decreased more than 100, - 1882

The revenue from the import duties of Austria-Hungary from January to October, inclusive, in 1886, amounted in all to the sum of 34,278,902 florins, of which about 14,750,000 were collected in gold. This amount falls short nearly 4,500,000 florins of the duties collected during the same period in 1885.

PETROLEUM.

The figures showing the import of mineral oil from January to October (inclusive), 1886, when compared with those for the same period of 1885 prove quite conclusively that the artificial Russian oil has interfered seriously with the American petroleum trade in this Empire.

During the period in question, in 1885, 344,410 meter centners of light crude American oil were imported against only 159,673 meter centners in 1886.

The figures from 1885 show from January

ners heavy crude oil were imported, while during the same period in 1886 the figures mount up to 467,385 meter centners.

More conclusive proof could not possibly be furnished that the fraud upon the customs by means of the importation of Russian artificial oil has been completely successful, to the great injury of the treasury of Austria. The loss to Austria in the shape of unpaid duties during the period mentioned, if the decline of the importation of refined oil is taken into consideration, and if, furthermore, the fact is considered, as it should be, that all the Russian artificial oil imported is refined at the Hungarian refineries and pays a so-called consumption tax to Hungary alone, amounts, according to my calculation, in round figures to 4,000,000 florins.

No wonder, then, that the Austrian minister of finance has again and again attempted to persuade the Hungarian Government to suppress this much lamented and much criticised fraud and to agree to a strict enforcement of the tariff according to its spirit and intent. But thus far all efforts in this direction have been in vain. Only a few days since a conference of the representatives of the two Governments took place in Vienna, and after a protracted session and animated debate of the question at issue the session was adjourned *sine die*, as far as can be ascertained, without reaching an understanding.

EXPORTS TO THE UNITED STATES.

The increase of the exports from Austria-Hungary to the United States forms one of the few bright leaves in the commercial history of this monarchy for 1886. The schedule herewith inclosed marked Schedule A, contains a statement of the exports from all the consular districts of Austria-Hungary (agencies included) for the year ending December 31, 1886, and shows an increase of exports of \$1,152,656.40 over 1885; and the schedule herewith inclosed, marked Schedule B contains a statement of exports from the consular district of Vienna during the four quarters of the year 1886. The value of exports from this consular district to the United States during this year is by far the largest since the establishment of the consulate at Vienna. In connection with the subject of the export trade from Austria to the United States, I desire to mention the results of my experience during the year last past with reference to the

BRANCH HOUSES OF AUSTRIAN MANUFACTURERS ESTABLISHED IN THE UNITED STATES.

I am quite well aware that this is not a new subject, and that American importers are fully cognizant of the injury to their business arising from the fact that European manufacturers establish branch houses in New York, Philadelphia, Boston, &c., to whom they invoice their wares at manufacturer's cost—that is, at a rate below that for which the importer is required to pay a profit in addition to manufacturing costs in the European mar-

This, undoubtedly, is the correct theory, but like most other theories it is sometimes difficult to carry it into practice. If the goods invoiced are staple articles, there is of course little difficulty in fixing the true market price, but if the invoice contains novelties, articles of luxury, the shape and quality of which change rapidly with the requirements of fashion, a consul will find it somewhat difficult to determine the value of these goods upon and from his own knowledge. Even a consul, educated as a merchant and with the experience of a long series of years in handling and dealing in merchandise, would be at a loss to fix the exact market value of such articles as fine metal or bronze ware, fans, leather goods, oil paintings, painted and decorated fancy glass-ware, terra cotta ornaments, statuary, porcelain, ornamented plaques, and other articles of luxury, all of which contribute in a considerable measure to the sum total of exports to the United States.

In this dilemma he has but one recourse, and that is to call in experts, *i. e.*, exporters and dealers in the articles mentioned, and to ask their opinion as to the value of the goods in question. But I have found, to my regret, that this sort of auxiliary is not absolutely reliable in detecting or proving an undervaluation.

The ramifications and connections created by trade are so intricate and the latter are often of so intimate a nature, that the real truth is not always attainable. Though the name of the shipper is not disclosed by the consul, these experts seem to know from the general shape, character, and appearance of the goods who the manufacturer is, and in most cases there is a certain reluctance to give an opinion even against a competitor in trade. There is a sort of commercial free-masonry extant among these gentlemen, which possibly, in their circle, is as powerful and influential as the *esprit de corps* in the army.

The question arises, If consuls by reason of the facts stated are not in a position to detect and to prove undervaluations, by what means is this purpose to be accomplished? Is there no adequate remedy against the practice by which European manufacturers export their products to their own firms, or to some man of straw (representing their firm in the United States), at mere manufacturer's cost, paying less duty than the honest American importer, and thus fraudulently placing themselves in a position to undersell all their American competitors? Is the experience to be repeated again and again and *ad infinitum*, that Europeans repair to an American port of entry, import their own European manufactures under the conditions mentioned, amass a fortune within a few years, and return to their home laden with wealth acquired in a country toward which they never performed or assumed the smallest duty as citizens, and for whose institutions, progress, and success they never cherished the slightest sympathy? Is it fair and just that these unconscionable cosmopolitans should enrich themselves at the expense of our countrymen and of our national Treasury?

The remedy for this condition of things, which my brief experience seems to suggest, lies with the appraisers and the experts cited by them at the port of entry where the shipments are landed. There is but one class of experts who can give a fair and impartial opinion as to the value of goods purchased in the European markets, and these are the

BELGIUM.

dents of the United States, representing a European manufacturer, it may well be expected that such experts will consider the cost of manufacture alone a fair criterion of the market price.

As a matter of course there are many shipments as to which the consul can gather satisfactory and reliable information, but when he cannot, then it would seem experts at the port of entry of the character and nationality mentioned could make a fair estimate of value.

EDMUND JUSSEN,
Consul-General.

UNITED STATES CONSULATE-GENERAL,
Vienna, January 15, 1887.

BELGIUM.

Report of Consul Slade.

COMMERCE.

The total importations and exportations of Belgium (including the transit trade) for 1885 amounted to \$964,440,300, or about 8 per cent. less than in 1884. This reduction does not, however, imply a decrease in the general movement of trade, as the price of all merchandise was materially less during the former year. The total importations in 1885 amounted to \$497,476,800, or a decrease of 7 per cent. as compared with 1884. The total exportations were \$466,963,500, or a decrease of 10 per cent.

The special commerce of Belgium (viz, foreign merchandise consumed in Belgium, added to the products of Belgian soil and industries exported to foreign countries) in 1885 amounted to \$491,590,300, or 8 per cent. less than in 1884. The total value of foreign merchandise consumed in Belgium in 1885 amounted to \$259,971,000, and in 1884 to \$275,160,100, being a difference of about 6 per cent. The total value of Belgian products and industries exported to foreign countries in 1885 was \$231,600,000, being 10 per cent. less than in 1884.

Exportations and importations (deducting transit commerce) of Belgium with the different countries for 1885.

Countries.	Importations.	Exportations.	Total.
Europe:			
France.....	\$49,890,500	\$62,126,700	\$112,017,200
Germany.....	32,732,800	39,314,100	72,046,900
Holland.....	37,943,800	35,261,100	73,204,900
England.....	32,539,800	45,914,700	88,454,500
Russia.....	17,968,300	1,177,300	19,145,600
Italy, Spain, Austria, &c.....	15,169,800	22,137,100	37,306,900
Other European countries.....	9,418,400	5,616,300	15,034,700
	46,455,100	14,668,000	61,123,100
	16,173,400	4,342,500	20,515,900
		1,042,200	2,740,600

During the first eleven months of 1886 as compared with the same months in 1885, the total importations have decreased 2 per cent., whilst the exportations have increased 1 per cent. The following are the principal articles imported which have increased:

Live cattle	\$1, 041, 235
Butter	498, 905
Flour	403, 370
Rice	360, 717
Meats	556, 033
Guano	1, 807, 831
Raw silk	742, 049
Petroleum	2, 582, 147
Leaf tobacco	522, 450

The following articles have decreased:

Building-material (wood)	444, 286
Wood for manufacturing purposes	539, 821
Coal	546, 190
Wheat	265, 761
Rye	300, 887
Barley	510, 871
Oats and corn	1, 100, 293
Linen thread	563, 753
Grease	693, 449
Raw tow	320, 380
Hardware and notions	209, 019
Copper and nickel	610, 459
Raw hides	504, 116
Sirup and molasses	257, 076
Woolen goods	417, 266
Oleaginous grain	1, 443, 254
Wine	331, 381

Of exportations for first eleven months of 1886, as compared with same months of 1885, the following articles have increased:

Live animals	\$427, 109
Horses and colts	615, 670
Candles	267, 305
Meat	346, 049
Rags	415, 143
Knitting-wool	1, 849, 326
Raw tow	490, 413
Raw flax	1, 732, 175
Raw silk	755, 209
Hardware and notions	297, 606
Steel bars and wire	354, 734
Manufactures of steel	204, 966
Old iron	258, 041
Sheet-iron	240, 864
Manufactures of iron	585, 369
Cast iron	129, 477
Raw hides	546, 383
Chemical products	280, 622
Raw sugar	1, 517, 366
Cotton goods	316, 906
Common glassware	310, 730

During the same period the following articles have decreased:

Coal	\$196, 860
Butter	
Rye	
Barley	

BELGIUM.

Copper and nickel	\$368, 883
Building-stone	521, 136
Woolen goods	935, 278
Oleaginous grain, (flax-seed, &c.)	281, 780
Hops	402, 405

COMMERCE OF BELGIUM WITH THE UNITED STATES.

The importations from the United States into Belgium, which in 1884 amounted to \$31,015,100, were reduced in 1885 to \$23,237,200, a falling off of 25 per cent. The principal decrease was in the following articles :

Grain of all kinds	\$8, 982, 209
Flour	894, 555
Cotton	551, 198
Rosin and bitumen	93, 026
Raw mineral ore	72, 182
Chemical products	68, 901
Coffee	51, 997
Raw hides	53, 075

The following articles increased:

Oleaginous grain (flax-seed, &c.)	\$937, 298
Leaf tobacco	806, 933
Copper and nickel	546, 383
Meats	530, 943
Lard and grease	399, 317
Sirup and molasses	99, 009
Art objects	66, 199

The exportations from Belgium to the United States, which in 1884 were \$7,643,800, fell off to \$6,407,600 in 1885, a decrease of 16 per cent. The following articles decreased :

Window-glass	\$769, 105
Rolled iron and iron bars	228, 898
Drugs	208, 633
Clothes	144, 171
Wooden ware	103, 062
Rags	86, 464
Tanned and prepared skins	79, 323
Arms	76, 621

The following articles increased:

Plate-glass and glassware	\$137, 666
Chemical products	100, 939
Hemp and flax	88, 008
Woolen goods	61, 567
Linen goods	57, 900
Machinery and tools	51, 917
Colors and dyes	42, 846

EXPORTATIONS TO UNITED STATES FOR 1886 FROM THE CONSULAR DISTRICT OF BRUSSELS.

The exportations from this consular district (as per accompanying table) for the year 1886 were \$3,124,285.46, being an increase of over 1885. The principal articles of exportation were as

COAL MINES.

The principal coal-producing district in the Kingdom is Hainaut (in this consular district). In 1885 the production was 12,925,815 tons (of 2,200 pounds), a decrease of 585,181 tons as compared with 1884. In 1885, 57,662 laborers were employed in the mines, a decrease of 2,359 from 1884. The average selling price per ton of coal during the year 1885, was \$1.71, being 14 cents less than in 1884. Since 1853 the price has not been as low as during 1885. The cost of production was \$1.63 per ton, a reduction of 15 cents per ton from 1884, being 11 cents on the cost of labor and 4 cents on other expenses. This is the lowest cost price since 1853. The profits of the remunerative mines have decreased (from 1884) \$16,103.06, while the deficits of the losing mines have decreased \$174,099.34. The estimated profit per ton was $8\frac{1}{3}$ cents in 1885, or $1\frac{1}{2}$ more than in 1884.

Comparative table for the years 1884 and 1885.

Items.	1884.	1885.
Laborers:		
In the mines.....	60,021	57,662
On the surface.....	18,768	19,203

Average selling price per ton.....	\$1 85	\$1 71
Average profit per ton.....	\$0 06 $\frac{2}{3}$	0 08 $\frac{1}{3}$

The following statement shows the number of mines worked and not worked, number of laborers, production, and pecuniary results for 1885.

Number of mines:	
Worked.....	80
Not worked.....	45
Pits for ventilation.....	89
Pits of extraction:	
Worked.....	187
In reserve.....	62
In construction.....	11
Average depth of pits of extraction..... feet..	1,762
Average width of coal veins.....	2
Laborers:	
In mines.....	57,662
On the surface.....	
Total.....	

Ordinary expenses.....	\$19,506,922 11
Extraordinary expenses.....	\$1,466,204 21
Total	21,073,126 32
Expenses for salaries and laborers.....	\$11,813,005 81
Other expenses	\$9,260,120, 51
Total production :	12,925,815
Quantity	tons.. \$22,144,200 47
Value.....	42
Number of paying mines.....	\$1,419,334 35
Profit on same.....	39
Number of unremunerative mines.....	\$348,260 20
Loss on same	\$1,071,074 15
General profit of all mines	

The total number of laborers were subdivided as follows:

In mines:	
Men	45,551
Women.....	3,995
Boys (under 16 years of age)	6,534
Girls (under 16 years of age)	1,582
Total	57,662
On the surface:	
Men	12,543
Women.....	2,709
Boys (under 16 years of age)	2,113
Girls (under 16 years of age)	1,838
Total	19,203

The average daily wages for 1885 was as follows (avoiding fractions):

	Cents.
Men	60
Women	32
Boys	27
Girls	21

The following are the annual average wages per laborer for the last ten years:

Years.	Amount.	Years.	Amount.
1876.....	\$199 75	1881.....	\$178 72
1877.....	160 77	1882.....	185 28
1878.....	161 35	1883.....	194 35
1879.....	165 36	1884.....	175 82
1880.....	176 98	1885.....	153 63

During the same term of years, fortunately for the laborer, the prices of the necessities of life have materially diminished. The following table will show the average price of wheat and potatoes, the two staple articles of consumption, since 1850 :

Wheat, 220 pounds.	Potatoes, 220 pounds.	Years.	Wheat, 220 pounds.	Potatoes, 220 pounds.
--------------------------	-----------------------------	--------	--------------------------	-----------------------------

STONE AND MARBLE QUARRIES.

Number of quarries in the province of Hainaut (of which 445 are above ground and 88 under ground).....	533
Number of laborers employed.....	11,280
Horses employed.....	714

Value of products.

Marble, stones for ornament, and building-stones.....	\$1,061,242 34
Limestone.....	864,147 85
Paving-stone.....	389,477 86
Chalk, silex, clay, and sand.....	193,861 17
Sulphate of baryte.....	4,053 00
Phosphate of lime.....	614,068 10
Total.....	3,126,850 32

The following table gives the value of the productions of quarries in same province from 1880 :

Years.	Value.	Years.	Value.
1880.....	\$3,350,509 91	1883.....	
1881.....	3,718,689 26	1884.....	\$4,384,960 00

CONSULATE OF THE UNITED STATES,
Brussels, January 14, 1887.

WILLIAM SLADE,
Consul.

FRANCE.

Report of Commercial Agent Coleman.

The great local industry of St. Etienne is the ribbon industry, almost as important as all the rest combined. This industry, introduced into St. Etienne in the tenth century, was for a long time inferior to that of St. Chamond, where at present, however, are made only special articles, such as braids, for example. It is at St. Etienne exclusively that has existed for forty years the public test for silk destined to be manufactured into ribbons. The manufacture of velvets and ribbons absorbs annually from 5,000 to 6,000 kilograms, about 10,000 or 12,000 pounds of silk, representing from 30,000,000 to 35,000,000 francs, or about \$7,000,000. The value of ribbons manufactured is from 70,000,000 to 80,000,000 francs, or \$16,000,000. The "rubanerie" or ribbon industry of St. Etienne is carried on by about 250 manufacturers, who are engaged in making many different articles, such as plain black, colored, and figured ribbons, velvets, elastic goods, trimmings, braids, cravats, cords, galloons, &c. These manufacturers employ 18,000 looms and 50,000 workmen. The greater part of the looms of St. Etienne are worked by hand and belong to the workmen themselves, who own small factories of from 2 to 4 looms. Generally these looms are very well arranged and perform wonders. The manufacturers of St. Etienne, in view of the constant changes in style, find a great advantage in this arrangement, which, however, seems little in keeping with our age. A manufacturer who creates a new article finds looms to produce it at smaller cost than if he had extensive works and were obliged to change all his machinery. Looms for velvet generally belong to the manufacturer, as well as those for the fabrication of elastic goods. It is estimated that the

man with a loom able to produce the article in vogue will gain from 10 to 20 francs—about \$2 to \$4 per day—another with a loom producing a less stylish fabric will make but 2 or 3 francs—say from 40 to 60 cents per day. Till the year 1872 work was regular enough at St. Etienne. Economical workmen grew rich, and most of the houses in the city were built by them. Since then the condition of workmen has been less favorable, wages have been smaller, and many have been out of employment. The manufacturer, too, has suffered, and now that business has revived it is hard to find the skilled labor which is needed. The ribbon production of St. Etienne formerly amounted to 110,000,000 francs (\$25,000,000) yearly; this included braids also, which are now principally manufactured at St. Chamond. To-day the combined production of St. Etienne and St. Chamond is estimated at not above 90,000,000 francs—say \$18,000,000 yearly. Till the year 1872 two-thirds of the ribbons manufactured were for exportation. To-day those destined for exportation do not exceed one-third. It is alleged by the manufacturers in imposing such an enormous tariff upon their productions. It is stated by the president of the chamber of commerce that the exportation of ribbons to the United States formerly ran as high as 25,000,000 or 30,000,000 francs. If this be true, there is certainly a very great change from the past to the present figures.

From publications made by the "chamber of textiles," an approximate estimate has been made of the total ribbon production of St. Etienne for the years 1881, 1882, 1883. A table is hereto annexed and made a part of this report. This table shows that, unfortunate as was the year 1881 for the ribbon department, still the total valuation of the ribbon production for that year was 63,400,000 francs. This was 4,210,000 francs more than the production of St. Etienne for the years 1884 and 1885. The only official figures for these years must be accurately than I have the ribbon production of St. Etienne for the years 1884 and 1885. From the table given below it will be seen that the total ribbon exportation to the United States for 1884 was \$576,243.02, and for 1885 was \$498,323.57, the decrease for 1885 being \$77,919.45. The total exportation of ribbons to the United States for the year 1886 is \$793,271.60, showing an increase of \$294,948.03 over the year 1885. Thus it will be seen that there is a very decided improvement this year in the ribbon exports to the United States.

iron trade in 1882 proved to be, on the whole, unusually steady, the quotations throughout the year being nearly the same. Prices for merchant iron in the Paris market ranged from 21 to 19 francs per 100 kilograms, and although a considerable competition by foreign producers began to make itself seriously felt during the latter part of the year, the market continued remarkably firm to the end of the year. Building operations in Paris being very active during this year, transactions in every description of iron—bars, plates, slit iron, angles, hoops, &c.—remained numerous and fairly remunerative. In the beginning of 1882 many orders taken in 1881 remained to be filled, and the great activity which prevailed in the construction of public works and in the carrying through of the so-called Freycinet schemes caused many new ones. To satisfy the demand thus created numerous plants were erected or brought near completion during this year, among which may be mentioned several converters intended for the production of steel by the dephosphorizing process, in addition to the five already in operation in France. As to novelties in the manufacturing of iron the year 1882 has no more showing than its predecessor. It is perhaps of interest to mention that a discovery of iron ore has been made at Heywien, in the department of the Isère, belonging to this consular district, by a company searching for coal-measures. They met, instead, with a large bed of hematite iron of about 5 meters' thickness. This discovery will no doubt prove in the end an important accession to the metallurgy of the Loire district. The total output of French metallurgy in 1882 was 3,570,296 tons against 3,070,036 tons in 1881, showing an increase of 500,260 tons. The district of the Loire had its due share in that increase, although I am unable to state in exact figures the percentage of its increase.

But favorable as 1882 proved to be for the French metallurgist, an ominous symptom, indicating even worse consequences in store for the future, showed itself at the end of that year. On the 7th of May, 1882, one year after the promulgation of the revised French general tariff, the new treaties and connections with the different European powers had come into operation. As the duties on articles of the metallurgic line had been reduced, the importation of materials, especially those needed for railroad building, such as axles and tires, naturally increased. The result was that after a seven months' trial of the new legislation the balance of trade was, at the close of 1882, already in favor of foreign producers, thus proving that the new commercial treaties did not work well as far as the interests of French metallurgy were concerned. Still, it was hoped that the completion of the important public improvements would be steadily carried on by the Government, so as to secure at least a modest number of orders to the French metallurgist. The new year of 1883, therefore, brought expectations not over sanguine, it is true, as all hope for a continuance of the great commercial revival of 1879 had been long abandoned, yet presaged no gloomy prospects for the future. But in the course of events 1883 proved a most deplorable year for all concerned in metallurgy. Financial embarrassments consequent upon the foreign policy of the French Government caused the public works to curtail or postpone.

crisis of 1883

by the state. Being under the apprehension that a repurchase of their roads by the state—provided in the different charters and warmly advocated by influential political parties—might be carried, they proceeded to apply for a revision of the old charters. In the mean time they restricted their orders to their most pressing needs, prudently conforming themselves to the marked decline in their receipts.

Besides this, the crisis, already bad enough, was aggravated by the competition of the large metallurgical establishments which had been erected at St. Nazaire, at Bayonne, and in other parts of the country. The new plants had raised the producing capacity of French metallurgy to 600,000 tons per year, while the home consumption did not exceed 250,000 or 300,000, leaving thereby on the hands of the manufacturer a surplus of at least 300,000 tons, which could not be sent abroad, save at prices almost ruinous. Thus was exportation, which means successful competition with England, Belgium, and Germany, rendered impossible. Under such circumstances, it is not to be wondered at that stocks accumulated and prices, from the beginning of 1883 to the close of the same year, went gradually but steadily down. Merchant iron, bars, plates, &c., decreased from 195 francs in January to 160 in December in the Paris markets. Bessemer steel rails were, in December, worth 160 francs, while in the flush times, before the crisis, 180 was the minimum price, and the cost price in the Loire district exceeded 160 francs. Hence further manufacturing of this article became impossible. To sum up, the year 1883 was characterized by overproduction and low prices, such as generally did not pay the producer, and feverish and uncertain trade. Furnaces had to be put out of blast in the north and Moselle region, as well as in the Loire district, and mills had to be stopped in order to check overproduce. Many workmen were dismissed, wages were reduced, and, as a matter of course, strikes followed, and up to the end of the year the crisis remained in full force. The total production of French metallurgy, foundry-iron, forge-iron, and steel included, amounted to—

	Tons.
1881	3,070,036
1882	3,570,296
1883	3,524,500
1884	2,759,318

showing at the end of 1882 an increase of 500,260, and at the close of 1883 a decrease of 45,796 tons, leaving to the year 1883 an excess of production over 1881 of 454,464 tons.

The following figures show to what degree the metallurgical portion of this district—the departments of the Loire and the Isère—took part in the general production. Participating with 299,949 tons in a total production of 3,524,500, the two departments represented in 1883 about 8½ per cent. of the general output, while in 1881 they shared in it with a little more than 10 per cent. It may not be amiss to add that some works in the Loire region by the war and in July, 1883, to works in the district and helped to keep up its products,

MANUFACTURE OF ARMS.

Closely connected with this branch of industry (metallurgical) is the manufacture of arms, which has its seat at St. Etienne and its environs. The most important establishment engaged in the fabrication of weapons of every description for the army, the so-called "National Factory" has, during the years 1882, 1883, 1884, and 1885, continuously pursued a downward course. As far as I can learn, from private sources, official statements regarding this Government institution have at no time been published, but, on the contrary, have been guarded with strictest secrecy. I have made several attempts to obtain information, especially at St. Chamond, but every effort to visit the works or to obtain information has been unavailing. As far as I can ascertain, the number of hands employed in the national factory at this place for the last three or four years, say 1883, 1884, and 1885, have not averaged more than 1,500 or 2,000, while at the end of 1881 there was still a working force of about 4,000 men. It is not surprising, then, that with the gradually diminishing demand for work during this period wages went down to an almost starving rate, the wages of ordinary laborers being one franc or one franc and a half, say 30 or 40 cents, a day, and those of skilled workmen not more than two or two and a half francs, say 50 cents, per day.

It is rumored lately, however, that something like a revival of its former activity will soon spring up, as the army gun now in use is to pass through a process of remodeling; that work will doubtlessly be done by the national factories, among which that of St. Etienne is the most important.

What has been said of the Government factories of arms and the distressing condition of their employés, applies with equal force to the private branches of this industry. From the very fact that this branch has for its exclusive specialty the fabrication of "arms of luxury," it is to be inferred that it must have suffered, even more than many other branches, from the financial crisis and the consequent industrial stagnation of the last few years. Although I have not been able to obtain statistics giving the exact or even the approximate estimate of the number of arms produced here, I feel sure that the St. Etienne manufacture of fancy arms, from information I have gained, is losing ground from year to year, and is becoming less and less.

industry, 1882 and 1883, was about half a million of tons larger than in 1881, in consequence of which the demand for the universal fuel increased proportionably. A statistical table published in the *Écho des Mines*, by Mr. F. Laur, gives the quantity of coal mined in the Loire region as amounting to 3,620,550 tons for 1882, and to 3,651,860 tons for 1883. It may be said, therefore, that, as to the quantity of coal mined, these years cannot be accounted unsuccessful, yet the general calamity brought on by the financial and industrial crisis in metallurgy had a damaging effect upon mining interests, resulting in the retrenchment of wages of employés. The following table shows the production of coal in this consular district for the year 1884:

	Tons.	Value.
Consular district.		0 80
Department of the Loire	3,152,184	\$9,573,428 00
Department of Isère	158,494	31,69

The following will show the production of coal in the department of the Loire for the respective years:

	Tons.
1881	3,479,356
1882	3,568,909
1883	3,586,802
1884	3,152,184

The decrease for the year 1884 from 1883 being 499,676 tons.

The following translation of an extract from the *Écho des Mines* by Mr. F. Laur, engineer of mines, is interesting for the information contained in it on the subject of mines and metallurgy.

Output of coal from the basin of the Loire in 1883.

[Result of semi-annual reports of our five principal companies in 1883.]

	Tons.
Firminy and Roche-la-Molière	585,444
Montrambert-Beraudière and Montcel	591,675
Loire	460,998
Mines of St. Etienne	577,110
Rive-de-Gier companies	204,932
Total output from the basin of St. Etienne	3,110,910
Rive-de-Gier	488,143
Total	3,599,053
The total output had been St. Etienne	3,055,718
Rive-de-Gier	513,191
Total	3,568,909

The output, then, of 1883 exceeded that of 1882 by about 30,000 tons. The *Écho* gives the production of the two basins of the Nord and of the Pas-de-Calais, making together 10,051,459 tons. On the metallurgic production of the Loire we have interesting figures. The statistics we could not get so much in six months. The statistics of 1882, is the

As can be seen, there is a decrease of 25,000 tons in the manufactured article, iron and steel about 10 per cent. If the ore has suffered a diminution of only 4,000 tons, it is because there must have been introduced into the department foreign ore, which is again a bad symptom.

THE METALLURGICAL PRODUCTION IN AMERICA.

The condition of metallurgy in America is analogous to that in Europe. In 1883, if the production was not diminished, the prices, on the other hand, were sensibly lowered. Many owners of foundries put out their fires because the future promised no more remunerative prices. The year 1883 produced, in round numbers, 4,948,000 tons of ore; in 1882, the yield had been 4,623,000, say an increase of 325,000 tons. The production of steel rails in 1883 was inferior, by 100,000 tons, to that of the preceding year. To sum up, it is to be seen that our neighbors, the American iron-men, cannot congratulate themselves more than their European brethren on the results of 1883. On the other side of the Atlantic they allege excess of production as the principal cause of this state of things. It is the same on this side. Metallurgy realizes, to some extent, Pharaoh's dream of seven fat kine always followed by seven lean kine; the number seven varies, but the succession of the kine remains invariable.

For any information about the glove business of Grenoble, the lace industry of Le Puy, the cotton goods of Terare, the "Chartreuse" of Voiron, and the glass manufactories of St. Just, I have to rely exclusively on the table of declared exports, herewith inclosed, being left absolutely without any other statistical information.

DANIEL COLEMAN,
Commercial Agent.

UNITED STATES COMMERCIAL AGENCY,
St. Etienne, January 1, 1887.

GERMANY.

Report of Consul-General Raine, of Berlin.

The universal complaint of German trade and industry in 1885 was caused less by stagnation and decline of business than by low and unprofitable prices. It will appear from the subjoined comparative table that the commercial balance against Germany in 1885 was higher by about \$14,000,000 than in 1884, while the year 1883, showing the largest amount of exports, closed with an excess of about \$3,000,000 exports over imports. Official returns give the following figures of Germany's special commerce (exclusive of goods in transit) in the last fourteen years:

Years.	Imported.	Exported.	Years.	Imported.	Exported.
1872	\$825,498,000	\$586,574,000	1879	\$926,534,000	\$671,160,000
1873	1,013,666,000	592,620,000	1880	913,920,000	723,520,000
1874	874,174,000	599,046,000	1881	871,080,000	709,240,000
1875	851,295,000	605,820,000	1882	744,940,000	759,220,000
1876	931,365,000	606,750,000	1883	775,880,000	778,260,000
1877	947,240,000	657,451,000	1884	781,830,000	778,022,000
1878	885,995,000	640,220,000	1885	711,620,000	693,770,000

GERMANY'S INDUSTRIAL PROGRESS DURING THE LATTER HALF OF THE CENTURY.

A comparison of the state of industry twenty-five years ago with that of the present time is quite instructive. Taking standard conditions as 100, the upward tendency will be seen by the figures, put in juxtaposition, for the latest years reported:

		Standard conditions and proportionate increase.
Population	100 in 1860	: 124.1 in 1885
Output of coal	100 in 1861	: 412.5 in 1885
Pig-iron produced	100 in 1861	: 617.1 in 1885
Sugar produced	100 in 1871-72	: 602.3 in 1884-'85
Beer produced	100 in 1872	: 152.8 in 1884-'85
Total imports for home consumption	100 in 1872	: 131.2 in 1884
Exports	100 in 1872	: 190.7 in 1884
Length of railroads	100 in 1872	: 214.3 in 1883
Number of post-offices	100 in 1868	: 167.9 in 1883
Number of telegraph offices	100 in 1874	: 225.4 in 1883
Goods traffic on large rivers and canals	100 in 1874	: 370.0 in 1884
Sea trade in German ports	100 in 1860	: 181.0 in 1884
Pig-iron consumed	100 in 1874	: 155.6 in 1884
Coal consumed	100 in 1872	: 177.5 in 1884
Petroleum consumed	100 in 1872	: 141.8 in 1884
Cotton consumed	100 in 1866	: 346.6 in 1884
Wool consumed	100 in 1866	: 3276.7 in 1884
	100 in 1872	: 624.0 in 1884

Another cause consisted in the unfavorable economical condition of France, England, the United States, and of large portions of South America; while Russia's almost prohibitive rates of duty did not foster the importation of German articles. But the principal cause of the decrease of imports by 316.4 million marks (\$75,400,000) and of exports by 344.7 millions (\$82,000,000) in value during the year 1885 as against 1884 must be ascribed to the steady decline of prices both of raw material and manufactured articles.

A.—Average wholesale prices of chief articles in the German Empire during the years 1880–1885 and in the month of August, 1886.

Puddling-coal, good quality							
Saarbruck, open-burning coal							

Many manufacturers carried on their business with a profit next to nothing, and, in numerous instances, for the mere purpose of retaining, in anticipation of better times, skillful laborers, who, if dismissed, would go to fill the ranks of dreaded competitors.

In 1886, however, signs of a revival of business were noticed, and prices show towards the end of 1886 a considerable rise, as compared with prices in June last, especially in metals, cotton, hemp, wool, silk, and flax, while cereals declined.

Exporters stated to me that consumption of stock had given the first incentive to trade in many instances. But in my opinion there can be no doubt that a brisk exportation set in when the United States sent large orders in consequence of the strikes and labor disturbances then prevailing at home.

According to consular reports the German Empire exported to the United States in the year ending September, 1886, \$76,588,045.18, as compared with \$60,968,801.39 in 1885, making a total increase of \$15,619,243.79, or 25.6 per cent.

Ba.—Value of declared exports from the consular district of Berlin to the United States during the four quarters of the year ending September 30, 1886.

* Ton = 22 cwt.

A noticeable increase took place in scrap and pig iron (56,000 tons) and manufactures of iron (68,990 tons).

The condition of textile industry is reported to be more favorable than has been the case for many years past. The increase of woolen yarn exported in these nine months amounted to about 22,000 cwt.; silks and half silks, 19,000 cwts.; linen and jute articles, 4,400 cwt. An increase is also reported of exported wood and leather articles, of wine, &c.

On the other hand, the quantities imported of nearly all the items set forth in Exhibit C show a decline, in some instances to a very considerable extent, so that in this year the commercial balance is evidently in favor of Germany.

The first six months of the German fiscal year, commencing April 1, and taxes in excess of

The total amount of revenues from these sources being 167,833,560 marks in 1886, against 151,594,487 marks for same half year in 1885.

STATEMENT OF A REPRESENTATIVE OF THE IMPERIAL GOVERNMENT.

In the recent debates of the German Reichstag on the enactment of the German-Spanish treaty of commerce, in which the Liberal party attempted to make the protective policy of the Government, adopted since 1879, responsible for the decline of trade in 1884 and 1885, the representative in response pointed to the fact that the chief articles of export in Germany, such as cattle, sugar, spirits, and iron, had extraordinarily receded in price.

Suppose [he demonstrated] we underlay to our export returns of 1885 the prices of the most favorable year of the so-called "free-trade" period (prior to 1879), we would arrive at a figure of 4 milliards of mark for exports in 1885, a figure which cannot be shown by any single year of the free-trade period.

He continued to argue that it was altogether due to the increased exports within the last years, chiefly to America, that Germany succeeded in getting back from abroad those 600,000,000 marks in gold, which, owing to its former unfavorable commercial balance, had left the country. As a "reliable barometer," as a "mathematical proof of the nature of Germany's foreign relations," he mentioned the rates of exchange for bills, which for two years past had been in favor of Germany. Gold on hand continued to increase, coming in from abroad. Two factors regulated commerce with foreign nations: Balance between imports and exports of goods, and credit and debit of public securities (stocks and bonds).

Nevertheless a Berlin paper of influence expresses the opinion, in the face of the above figures, that many of the convinced adherents of the dominant protective policy begin to entertain doubts about the success of the latter. They compare the period of the very first commercial treaties with the politico-commercial events of more recent years with a view to imminent political disturbances most likely to occur before long. Those treaties were concluded for a number of years; the exterior calmness of commercial relations then seemed to be secured and not exposed to disturbances such as nowadays are coming from divers quarters, and at unaccountable intervals troubling, almost uninterruptedly, business and trade.

During the decennials for which those treaties were concluded the custom tariffs of the respective countries remained nearly unchanged, and the manufacturers were therefore able to control, easily, their foreign commercial relations.

The comparatively long term of duration of the treaties gave them guarantee that the economical policy of the several countries could not, will and at a chosen time, change business calculations.

Since the expiration of the treaties (in the years from 1860-'70) this state of things has totally changed.

The treaty of 1860, concluded by Napoleon III with Great Britain, tended to reduce the rates of the general French tariff in order that this reduction might be followed gradually by other reductions, preparing the way for free trade; other states followed the example, and the whole movement resulted in a haggling about the rates.

made under Napoleon III had only served the interests of Great Britain, by securing to this country industrial preponderance. The demand for higher duties became then more and more general, and the repeated prolongation of the term of treaties was only intended to gain time for new negotiations.

But all these preparations had but one object, namely, to introduce a tariff serviceable as a weapon for new treaty negotiations. To grant further reductions of tariff rates was by no means intended.

The later treaties distinguished themselves from the former by the small number of stipulations as to tariff rates, while the old treaties, not uncommonly, were based upon true conventional tariff rates. The autonomy was thus restored to the several contracting states, and the era of high protective tariffs recommenced.

A change has, as already alluded to, also taken place regarding the term of treaties, in order to obtain back, as soon as possible, freedom of action for a quick utilization of experiences made. Treaties are in recent times concluded only for a few years.

In 1878 Italy introduced a new tariff with a long list of increased rates. Germany followed in 1879 with its tariff for the protection of "national labor"; France in 1881, transforming its ad valorem duties into such collected by weight, but, implicitly raising duty rates. Austria-Hungary followed in 1882. In Switzerland a higher tariff was passed in 1885, and this year, 1886, Roumania enacted a general tariff. Amended tariffs are said to be once more in preparation in Germany, Austria, Italy, and France. It is stated that Brazil recently has given notice for the expiration of all commercial treaties with European countries which lapse in 1887.

No wonder that manufacturers have become demoralized and despondent.

PROTECTIVE MEASURES CLAIMED FOR GERMAN SOCIAL REFORM.

Ever since the dogma of protection was promulgated a great transmutation in social political views has taken place. Germany took the leadership in adopting a so-called social legislation.

Acquisition of all railroads by the state, acts providing for sick and invalid laborers and seamen, are only preliminary steps in this direction. The intervention of the state in industrial matters, its providence and care for the economical and moral prosperity of its subjects, become more extended. A Berlin paper says:

Protective duty is not only the first step towards social reform, but also its first condition. The same has created new economical bodies, a new national order, dividing, so to say, the international economy into national groups of as high a development as possible. To continue the structure upon this basis also, in an international respect, is now the task of the future.

The writer thinks here of treaties or conventions to establish a uniformity in laws for the protection of laborers, their wives and children, of humanity.

land and France, in Belgium, and of late also in the United States and in Italy, bloody riots and a brutal destruction of property. * * * England, with its free trade, has, within the last six years (since 1879) made less economical progress than Germany. While the English export trade has remained almost stationary since 1879, German commerce and also production of coal and pig-iron has considerably increased. If this was possible in England, despite her immense wealth in capital, her long-established commercial relations all over the globe, it is at any rate evident that a protective system—which at least secures the home market—has comparatively upset the free-trade theories of England and Belgium.

On the same topic the London Times of September 6 last wrote a lengthy article, from which I may be permitted to quote a few interesting passages:

But a time has come at last in which other nations are entering into active competition with us, and in which that competition is aided and fostered by every means which their respective Governments can command. Among these means must be numbered the acquirement of colonies and trading stations, the support of manufactories, and the active assistance of ministers, consuls, and agents. * * *

There is the fact of the presence of an army of private or commercial agents, whose first care it is to master the languages of the people to whom they are sent, to understand their wants and their prejudices, to ascertain the qualities which they most highly value, and to keep their employers informed on these matters in such a way as to modify the character of the goods which are exported. * * * A traveler or agent should be acquainted with the technical processes of the manufacture of the article in which he deals, so as to see what variations in the character of these articles would be practicable as well as commercially profitable. * * * A mere desk training is not sufficient, and should be supplemented by time spent in the workshop. No amount of consular interference will preserve the trade of manufacturers who fail to adapt their wares to the requirements of consumers. * * * We believe that the commercial success of the Germans in many countries in which they have only recently obtained a footing is in large measure due to their devotion to work, to their being content with small profits, and to the fact that they stick to business while their rivals are amusing themselves.

A BRITISH CONSUL ON GERMANY'S IMPORTS INTO SPAIN.

As under the new consular convention, just ratified between Germany and Spain, their reciprocal relations deserve notice, I add here an extract from a report of the British consul at Madrid as to German imports. He reports that the export in 1884 reached an extent twenty-six times larger than it was in 1885, that the Spaniards complain frequently of the shoddy quality of German goods; nevertheless the German traveler gained the precedence over his French and English rivals. The former understood the Spanish language and got, therefore, great advantage over those who must offer their services through an interpreter or simply produce their price lists. In Malaga, the consul states, exists a colony of young Germans, who there acquire the Spanish language and study the tastes of the people.

FRANCE AND GERMANY.

France, some time ago, delegated to Germany one Mr. Amédée Mar-teau, with the special instruction to study the present condition of German industry.

The *Petit Journal* published recently on this subject.

GERMANY.

German imports into France, and the decrease of French exports to Germany, viz:

GERMAN AND FRENCH EXPORTS TO THE UNITED STATES.*

While Germany in 1877 exported to the United States for \$27,971,512.29, and France, \$49,183,691.47; Germany in 1886 exported \$76,588,045.18; France, \$64,979,036. Thus exports to the United States in the last nine years went up from Germany by \$48,000,000; from France only by \$16,000,000.

JAPAN AND GERMANY.

A report of a German consul in Japan speaking particularly of im-ports of drugs and chemicals, says:

China and England depend here on German firms through which business is transacted, especially during the last three years, since the introduction of a regular direct shipping opportunity from Bremen and Hamburg to Japan. German chemical and pharmaceutic preparations have become so popular that during 1885 Japanese buyers made it a condition that these articles should be of German origin.

REVIEW OF THE ECONOMICAL YEAR 1885 IN THE PRINCIPAL CIVILIZED STATES.

Prof. E. Struck, of Aix-la-Chapelle (see Schmoller's *Jahrbücher*), gives the following figures as to the extent of decrease in exports for 1885 as against 1884:

	Germany.	England.	Austro-Hungary.	France.	United States.
	<i>Marks.</i>	<i>Marks.</i>	<i>Marks.</i>	<i>Francs.</i>	
Exports.....	316,000,000	320,000,000	56,000,000	137,600,000	\$41,700,000
	344,700,000	400,000,000	4,600,000	47,000,000	60,600,000

A retrogressive movement is noticeable also in the inland trade of these states. In this respect Germany appears to be better off than the other states:

Years.	Revenue from railroads.	Circulation of Imperial Bank.	Production of pig-iron.
1884	<i>Marks.</i> 888,180,000	<i>Marks.</i> 12,130,000,000	<i>Tons.</i> 3,562,000
1885	892,000,000	12,547,000,000	3,652,000

In England the revenues from railroads amounted to £54,000,000 (£1,000,000 less than in 1884).

The returns of the London Clearing-House fell from £5,755 to £5,502 *i. e.*, by £253. Pig-iron production went down from 7,530,000 to 7,250,000 tons; the number of bankruptcies went up from 4,394 to 5,089.

In Austria-Hungary the receipts from railroads increased by 800,000 florins only; the returns in bills of exchange declined from 630,000,000 to 510,000,000 florins; raw iron production from 352,300 to 344,600 tons.

In France the loss in railroad receipts was considerable—38,000,000 francs.

French papers of recent date point emphatically to the unexpected influence which the St. Gothard Railroad exerts upon French railroad and maritime business. This railroad establishing the best and most direct communication between the countries of Northwestern Europe and Italy, the Suez Canal and India, receives, so to say, as the main river all the tributaries of export business from its adjacent countries. Even Northern France sends its goods by this way to the Levant, &c.

The returns of the Bank of France fell, with 1,266,000,000 francs short as against the preceding year; pig-iron production diminished from 1,872,000 to 1,629,000 tons.

In the United States revenues from railroads remained at the same height, and only comparatively small decreases occurred in the returns of the different clearing-houses (\$43,905,000,000 to \$41,961,000,000), and in pig-iron production from 4,590,000 to 4,530,000 tons, while the beginning of an improved economic condition showed itself in the smaller number of failures (total liabilities fell from \$226,000,000 to \$124,000,000) and the increased number of furnaces in blast.

If the decrease of German imports and exports—apart from England—appears to be more considerable than in other States, and this particularly in view of the protection of agricultural interests; yet Germany, and next to it, America—probably owing to their protection of national labor—stand comparatively favorable, inasmuch as inland trade and consumption are concerned. Worse in every respect appears to be England.

In contradiction to Professor Struck's deductions seem to be the views of another economist, the well-reputed Leroy-Beaulieu. In a treatise published in the *Revue des Deux Mondes* on "The decline of prices and the crisis in international trade," he states, among many other very noteworthy data, the true causes of overproduction as follows:

The opening of large continents; the improvements in ways of trade and traffic; in

cause pressure from taxes but also withdraw means from private enterprises.

The household of the world [a commentator adds] has entered upon a new era; the causes and effects are of so profound and far reaching a character that all explanations deduced from superficial, transitory, incidental, and single occurrences or measures must be regarded, from the very outset, as a failure and a fallacy.

These inferences of a free-trader seem to be in contrast with reported indications of the merits of the German protective policy since 1879.

Thus wages show a rising tendency, and the statement in my last annual report "that the only class of people who derive advantages from low prices of provisions, with permanent work, while wages remained unchanged, are the workingmen," holds, to say the least, true also at this time, and not only this. A fact to which in this connection weight must be given is, that since 1879, the year of the inauguration of a protective policy, Germany's population experienced an increase by 3,000,000 persons, the largest portion of which must be counted as belonging to the working classes; and yet no lack of work was noticeable. Further, the savings of the less affluent people in Prussia show a constant rising percentage. The savings banks in Prussia reported for the last year, 1884-'85, an increase of 1,042,000 marks over the year 1883-'84.

Considering the amounts invested, the following classification is reported for 1884-'85:

Amounts invested.	Increase.	Per cent.
	No.	
Up to 60 marks.....	97,565	9.54
Over 60 to 150 marks.....	54,858	8.49
Over 150 to 300 marks.....	30,029	5.22
Over 300 to 600 marks.....	20,731	4.69
Over 600 marks.....	23,049	7.92
Total.....	272,232	7.54

The percentage of the smallest investments up to 60 marks, which in the years 1872 to 1876 permanently fell, and since 1879 first slowly but from 1882 very considerably rose, shows from the last year again an increase.

The total amount of all investments (amount of interest added) at the close of the year 1884-'85 was 149,375,423 marks.

These savings banks are almost exclusively used by the smaller people, while the more wealthy classes deposit their moneys with so-called deposit banks.

A decrease shows itself also in the number of paupers in Prussia receiving relief either from cities or townships, &c. Expressed in percentages, this decrease is as follows:

Items.	1884.	1885.
	27,279,111	18,313,833

619

life and movements of the people, if you observe trade and traffic, the circulation of capital, the rush for watering places, the increased facilities of transportation, &c., you will notice, as a rule, a more or less comfortable, thriving state of things. Of real undeserved poverty there is nowhere the question, even if the expenses of large cities for paupers increase in proportion to the increase of their total amount of expenditures, and of their working population * * * Of famine nobody can speak; opportunities of work for people willing to work are not lacking, perhaps with the exception of commercial clerks and technicians.

Against the noxious consequences of di-

Against the noxious consequences of diseases and injuries provision is made by sick funds, and insurance in case of accidents. Primary schools of an acknowledged excellent system are accessible, either free of charge, or at very cheap rates, to the lowest social classes.

That, as a rule, the great masses of the

That, as a rule, the great masses of the people enjoy a comfortable living, can be judged from their clothing, their dwellings, amusements, &c. Ragged people, excepting tramps shunning work, are but rarely to be found; on the contrary, a certain decency in clothing on Sundays and holidays and certain sumptuousness on festival occasions is perceptible. * * *

How considerably the property of our nation in foreign bonds and securities has grown is proven by the fact that two milliards of marks, the estimated amount of Russian state bonds, are in the hands of German holders. We possess a large number of shares and bonds of Austro-Hungarian and Russian railroads. We are creditors of Austro-Hungary, Roumania, Servia, Turkey, Italy, Egypt, Spain, Sweden, and Norway. Our banks have lately negotiated an Argentine loan, shared in the negotiation of a Portuguese loan, &c.

Mines and smelting works, at present comparatively in the worst condition, do not discontinue work, but enlarge and improve their works and plants—in the cities, activity in building houses; in the country, of canals, and as the main railroad lines are nearly completed, the construction of branch railroads; of iron steamers instead of wooden vessels is carried on; and finally, Germany can point to a well administered state budget, in which the items of loans are more than counterbalanced by property yielding interest, such as railroads, forests, domains, &c.

VIEWS OF A PESSIMIST.

It is but proper to complete this picture by the statements of a Conservative paper, pleading in favor of severe protection. The *Reichsbote* writes under date of November 3, 1886, as follows:

Every productive labor is complaining. Agriculture, trade, and industry show so low a state of prices of their products, that they are hardly able to produce any longer without risking economical ruin. One should think that with such low prices living would be cheaper than it was formerly, but the contrary is the case; the pressure of prices relates only to the wholesale prices, but not to the retail prices for consumers. Everybody complains that former incomes are no longer sufficient to meet both ends; not only the farmer and mechanic, but also the classes who live on their salaries or annuities, notwithstanding that salaries of state officials, &c., have been considerably raised in recent years.

Parents in the country, who must send their children to schools in the city, are nowadays compelled to expend double the amount as compared with former years. But not only the subjects complain of insufficient means, the states also are continually short of funds.

Nearly every fiscal year closes with deficiencies. In spite of the revenues having augmented immensely, the expenditures do outrun them notwithstanding, and a demand for larger revenues, by opening new sources of finances and taxes and duties, is addressed to the Parliament of the Empire and the several German states almost every session.†

Hence everywhere want of money to meet the necessities of life, with simultaneous complaints of low prices for productive labor. On the other hand, Germany has an abundance of money, more than this country ever possessed heretofore. The "Bourse" opens a subscription for any family, and the same is on the very first day.

How may these remarkable contradictory occurrences be explained? How does it happen that the prices of manufactures at the time of their production, hence the wholesale prices, are so low, may continue to decline, while retail prices are high and rather continue to rise?

This question is of the utmost importance, for in it lies the source of our calamities. The pressure of wholesale prices weighs upon the producer and places him in a compulsory condition, while the high retail prices again affect the necessities of life for the consumer; and both evils bear heavily upon the domestic trade and the production for home consumption, impairing with the great mass of population the susceptibility of consumption. Which are now the causes of this state of things? The chief cause, in our opinion, are the maneuvers of the "Bourse." The latter introduces foreign loans into our country, thus making us tributary to foreign states. Since these have no money they must pay the interest in products, and this at any price. But not only the interest, also manufactures exported by us to those countries have to be paid by them in products, consisting, as a rule, in agricultural products with which we are already overstocked. This subjects our farmers to such an enormous competition that their prices are pressed down and their susceptibility to consume domestic manufactures is weakened. Their sales at home are curtailed, and our industry is compelled to make constantly new arrangements for exportation. But appearing in the foreign markets it encounters the competition of all manufacturing states, and is thus under the necessity to underbid same by selling at prices receding more and more every day, thus causing a decline of prices through international rivalry. In order to make up to some extent for this shortcoming, our manufacturers seek to keep prices at as high a level as possible by the expedient of "cartels" [conventions].

Upon domestic retail prices, however, the intermediate or commission trade and the existence of large cities exert an immense influence. Through how many hands has grain to pass before it appears in the form of bread on the table of the consumer! Similar is the case with regard to meat, milk, vegetables; and, indeed, the price of provisions continues, at present, to be on the same level as many years ago, when wholesale prices of agricultural products were twice as high as they are now.

In smaller cities and in the country where producers entertain direct relations with the consumer, and are less dependent on the commission trade, the case stands not so bad as in large cities; in case of necessity baking and butchering can be done on one's own estate, but in the large city the intermediate trader has all connections in his own hand, and the more powerful he becomes, owing to an ever-increasing concentration of capital at single places, the more powerful becomes intermediate trade.

And prices of the large cities react on prices in the provincial towns and in the country generally.

In consequence of fluctuations and unprofitableness capital is withdrawn to a greater extent from production every day and turns to commerce, and particularly to the "Bourse." Thereby the rotation of evils just described, and thus the economic calamity is more and more intensified. The masses of capital pouring into the bourses whenever there is a loan negotiated, urge negotiators to devise schemes for new loans, and the more needy the countries are the larger commissions have to be paid to the financial agents, whose risk is but a very slight one.

The German capital going to foreign countries promotes there industry and farming, while those at home are impaired, and the borrowing country having no money is compelled to pay interest with its products. Thus the new loans for Buenos Ayres will force that country to export a larger volume of produce, and thus, by their competition, aggravate the condition of German farmers.

The growth of financial transactions in the exchanges of Germany is confirmed by an article of the London Pall Mall Gazette.

German merchants, by taking control of export trade, have attracted the adjustment of foreign debts to Berlin, Frankfort-on-the-Main, &c. English financiers and French bankers are amazed at the large progress made by Berlin as a money market. By its aid Russia bade defiance for years to the mistrust of Western Europe. Scandinavian loans were negotiated in Germany at prices that by far exceeded those which were willing to offer. Italian, Spanish, and German markets,

the rate of interest on loans, on depositing bonds of the Empire or the German states, to 4 per cent.; on depositing other collaterals, 4 per cent. This measure is regarded by financial circles as merely preventive, to strengthen the reserves of the bank. But as there is no scarcity of specie on hand, rather an excess above the average amount for the year 1885, and a decrease of the assets of bills of exchange, conservative papers explain the measure as intended against the speculation in foreign emissions and securities, considering the low rates of interest at home. This steady decline of rates of interest during the last years has led to a period of conversion of all domestic bonds and securities. The Prussian state commenced at comparatively brief intervals to reduce its 5 per cent. state bonds successively to $4\frac{1}{2}$, then 4, and recently proceeded to convert first-mortgage bonds of the railroads, acquired by the state, into $3\frac{1}{2}$ per cent. bonds. The example given by the state was eagerly followed by manorial, agricultural, township, and other corporations, so that during the last two years the chief activity of the financial world consisted in effecting such conversions.

German capital has thereby been injured very palpably, even if granted that Germany's wealth experienced a large augmentation in the last decade of years. This undesirable state of things has resulted in a demand for foreign paper, bearing the higher rates of interest. This affects largely the branches of industry, which, on the whole, are stated to be in an inchoate state of prostration, since a great change for the better is hardly expected in the near future.

The railroad systems and the transmutation of sailing vessels into steamers is now nearly completed in the chief countries of Europe. Thus the aims of industry are here nearly fulfilled, and now confined to mere repairing and supplementing inventories, plant—an irrelevant work in comparison with the astonishing achievements of the last four decennials.

But one of the large enterprises to be carried out in the near future will be the construction of the North and Baltic Sea Canal, necessitating a loan of about 150,000,000 marks. Nineteen millions have just been appropriated by the Reichstag as first installment. In past years various projects have been brought forward to connect the North Sea with the Baltic Sea.

The canal is to have its egress between St. Margarethen and Brunsbüttel, on the Lower Elbe, thence deviating and cutting through the Kudensee in the marshy district, following the valley of the little river Burger-Au, and proceeding by way of Burg (15 kilometers) to Gröndel (30 kilometers), the highest ground traversed. It then follows the valley of the Giesel-Au to Wittenbergen (42 kilometers), where it emerges in the Lower Eider.

The next place of importance on the route is Rendsburg (62 kilometers), which is passed on the north side; the canal then following the Upper Eider lakes, leaves the latter at 75 kilometers distance, cuts through the north side of the Flembuder Lake, and merges in the west side of the harbor of Kiel (99 kilometers). The locks necessary will be of a character to facilitate navigation to the greatest extent.

The canal is to serve both for military and commercial purposes. The total length of the canal will be 99 kilometers; the width of the surface, 60 meters; and at the basis, 26 meters, the depth being 81 meters.

Without danger of collision it is

It is estimated that the excavations will reach 64,000,000 cubic meters, and that 71,000,000 marks will be paid in laborers' wages. The canal will be crossed by four railroad lines.

The construction of this canal is looked upon as another effort to better the condition of trade and industry in Germany.

CONVENTIONS FOR FIXING PRICES.

Commercial papers contain nearly every week notices of efforts to conclude conventions, successful or otherwise, for limiting production and fixing prices.

Thus, *pourparlers* of the leading rubber manufacturers resulted in an agreement to raise prices for rubber balls by 25 to 30 per cent. By the way, Germany exports from about 5,000,000 to 6,000,000 marks of that article per year, which can only be made by hand. Its manufacture grants support to thousands of male and female laborers.

Six of the largest manufacturers of pig-iron of Upper Silesia, one of the two great mining districts of Prussia, concluded, on the 21st day of October, 1885, the following convention:

The undersigned works bind themselves up to the 1st of April, 1887, not to have more furnaces in blast than they have at present. Towards the end of this month a meeting shall be held in order to increase prices of pig-iron by all contracting works.

A like convention is contemplated by owners of rolled-iron works. One advocate of such conventions says:

The end of these price reductions cannot be determined as long as production and sale of German iron articles lack united organization of the manufacturers, and as long as the works, by continually increasing production in excess of demands, reduce their cost-price by little degrees, but, at the same time, involuntarily, to a smaller or greater extent reduce their selling prices, solely in order to place their products on the markets.

On the other hand, one or the other owner of iron works thinks, by cheap sales without profit, to ruin competitors. This, of course, may occur, and the late competitor may leave the work as a bankrupt, but the work itself, provided it be, both in its technical adjustment and geographical location, equal to the competing works, remains. It changes only the proprietor; the mortgage creditors are ready to acquire the works at a price far below its real value, and then, with a very low capital invested in the works, considering the cheaper cost-price, they are enabled to bring their product anew in the market, perhaps making the late victor a victim in the struggle for life.

DIVIDENDS.

Such complaints seem to be well founded. From a comparative statement as to dividends paid in the year ending June 30, 1885, with the estimated dividends to be paid this year, I learn that of 60 works (of which 47 are iron and mining works) only 3 are expected to pay a somewhat higher dividend this year, while 21 did not pay any dividend at all in both years. But there are exceptions. A machine work paid this year 33 against 27 in the preceding year; a dynamite work, 12 to 13 against 11, and a chemical work paid only $\frac{1}{2}$ per cent. dividend more this year.

It is granted that the change made in Germany's economical system was already the result of a calamity generally felt. This latter existed prior to the introduction of protective duties, and the same continues to exist in spite of same even to-day.

Concerning the influence of customs barriers upon the whole situation of international trade, it seems as if Germany had, under all circumstances, overrated the same. Notwithstanding considerable duties on grain, for instance, the prices for cereals constantly recede.

Free-traders deduce from this fact the uselessness of these duties, while their opponents claim that the state derives therefrom higher revenues without prejudice to consumers; but, nevertheless, the fact of low corn prices and a bad condition of farming remains.

Not the system of economy, but causes beyond the reach and control of state reformers, seem to further deteriorate the markets of the world. Over-population in all occupations, higher claims of all social classes in their modes of living, the transition of many nations hitherto mostly consumers to the side of producers, and the natural limits to the expansion of the market—all these circumstances combined had, of necessity, to conduce to an economical crisis that, irrespective of theories, has not failed to make its appearance in all countries, whether free-traders or protectionists, whether old or young—in short, everywhere.

A difference exists, perhaps, only in the degree of calamity. I have pointed already to one of the remedies, or rather palliatives, to which German manufacturers had recourse, namely, price conventions. Another is sought for in a further increase of duties (the next Reichstag will disclose this fact); further, in the conclusion or amendment of commercial treaties—a rather two-edged sword, as I have shown above. Copies of latest conventions I have not failed to transmit to the Department of State, viz., of German treaties with South Africa, Spain, &c.

Colonial policy is another catch-word. Tropical colonies are said to enable Germany to appear in the world's market as producer of articles for which heretofore it was compelled to pay England large amounts of money.

The excess of tropical produce imported into Germany over exports is as follows: Cotton, 179,000,000 marks; coffee, 123,000,000 marks; tobacco, 145,000,000 marks. The total amount of money paid for all sorts of tropical articles is rated at 780,000,000 marks per year.

Further, colonies shall serve to employ that mass of disposable working forces (who either are entirely unemployed notwithstanding their partly costly education, or serve to augment at home the surplus of discontented people) for the erection and production of raw material, and thus to enlarge the number of paying consumers.

The objection to the unhealthiness of African climate is refuted by the argument that Africa is no more unhealthy than any other portion of the globe situate within the same zone; and that if the Spaniards, in their time, on account of the fever climate, had allowed themselves to refrain from a farther advancement into America, it would be doubtful whether America had ever attained that important place which it to-day occupies in history and industrial development.

To give an idea of the methods and zones the "Cent"

colonial pursuits. The South American exhibitors, all German emigrants, show a great variety of natural products, raw material, and goods therefrom manufactured. There were stately pyramids of specimens of coffee, a hut of lumber of palm trees, a great selection of tobacco sorts, ground-nuts, &c.

The animal kingdom was represented by beautiful skins and covers of feathers, stuffed birds of magnificent plumage. Of the mineral

The animal kingdom was represented by beautiful skins and covers made of bird-skins and ostrich feathers, stuffed birds of magnificent plumage and luster, numerous samples of wool, &c. Of the mineral kingdom: ores, marble, and half manufactured articles.

As one of the best devices to incite trade and industry for exportation must be regarded the erection of a museum to exhibit in kind the produce and production of mankind, arranged according to the nations of the globe. Such an ingenious institution or rather academy of commerce was opened and inaugurated at Berlin, by Emperor William, a few weeks ago.

In a recent meeting of the Colonial Society one of the African explorers, Dr. Count Pfeil, alleged that they were aware already that their East African produce of cotton, coffee, and tobacco, &c., could stand competition.

On the 22d November a tobacco plantation company for East Africa was constituted with a stock capital of 1,000,000 marks, which was over-subscribed by 200,000 marks.

EMIGRATION.

EMIGRATION.

In my report No. 151, dated June 19, 1886, I pointed to the efforts of German colonial societies, &c., to direct the stream of emigrants to the states of the southern continent of America. The result of this activity in meetings and in the press begins to manifest itself.

Attention is called to the fact that such decrease is noticed only with reference to South America; on the contrary, the Plata states, is

Attention is called to the fact that such decrease is noticed only with regard to North America, but not to South America; on the contrary, emigration to the latter continent, especially to the La Plata states, is reported to be on the increase. The growth of commercial relations between Germany and South American states is pointed to as a cause of increased emigration. Thus, for instance, while in 1871 the Hamburg South American Steamship Company commenced to run four vessels only, and made, seven years ago, not more than twenty-four to twenty-five passages per year, to-day there is employment for twenty large steamers, making three times as many passages as heretofore.

In 1884 two hundred and ten German steamers, making 293,656, called at Montevideo. The immigration of Germany has this year considerably decreased.

E.—German emigration in ten years, 1876-1885.

As a sort of adjunct to the German Colonial Association appears the Herman Company, its object being the establishment of German agricultural colonies in Brazil. This company will enter into commercial life in the spring of 1887. The colony of San Feliciano, in the Brazilian province of Rio Grande do Sul, is the one immediately under consideration. A capital of 500,000 marks is thought to suffice, at the outset, to provide for steamship communication, road construction, and river regulation.

SUBSIDIZED STEAMSHIP LINES IN OPERATION UNDER ACT OF APRIL 6, 1885.

On the 30th June last the first steamer left Bremerhaven for East Asia, promptly followed by other steamers according to the time tables. The results of that measure have thus far been reported as favorable. The shares of the North German Lloyd rose in a very short time from 105 to 112. Against all apprehensions, the steamers came back with full cargoes, not only for Germany but also for other countries. A business of so-called "throughgoing (transit) bills of lading" between New York and China, Japan, &c., by the instrumentality of these new lines, has commenced greatly to develop through agents of the Bremen Lloyd in New York.

In Bremen the goods arriving from America are reloaded on board the steamers of the East Asiatic lines, which on the way home bring large quantities of tea for New York.

TRANSMARINE BANK.

The emancipation of German trade from the agency of English bankers is regarded as another expedient to promote German trade. Computations have been made that the sum which English banking houses derive from transmarine trade as commission amounts to about 6 millions of mark per year, of which Germany's commerce carries a considerable portion. Nearly the whole importation of raw material from Asia, Africa, and Australia is effected through English agents, while imports from South America chiefly feed agents at Havre, Antwerp, &c. Taking one article, cotton, for instance, it is stated that Germany in 1885 imported same through the mediation of English agents to the value of 4,207,700 kilowatts.

be authorized to buy and sell gold and silver in coin or bullion, to make, accept, buy, sell, and discount bills of exchange, to grant loans on deposit of bills, invoices, securities, and goods, to advance money on ship-tails from and to non-European states, collect moneys, &c. The details for the organization of such a bank, which is to be fathered by the "Deutsche Bank" of Berlin, have not yet been published, but it is stated that the stock capital is fixed at 10,000,000 marks. A branch establishment is intended for Buenos Ayres.

Besides this colonial bank the foundation of a German Imperial bank for transmarine banking is contemplated, and a bill is to be submitted to the Reichstag. This Imperial bank is to be a center for over-sea trade.

Another institution of apparent usefulness for German trade is the "Deutsche Handelstag," an association formed twenty-five years ago at Heidelberg. The same consists of the leading German merchants, manufacturers, and other influential men, and meets once a year at one of the large trade centers of this country. The meeting of this year took place at Berlin. All German boards of trade were represented. Its object is stated to be the interchange of experiences, the mutual communications of the various conditions within the several districts and business lines, by ascertaining the requirements of production, sale, and exchange of commodities, &c., at the different manufacturing and trading places.

The projected German national exhibition of trade and industry for 1888, though supported by many advocates, did not meet with the approval of the large iron manufacturers, for the reason that the utility of such an enterprise would be rather problematic, considering the frequency of exhibitions and the amount of expenses connected with them. On account of these objections the Imperial Government desisted from proceeding any further in the matter. Similar reasons were given for Germany's non-participation in the French exhibition.

SIEMENS' PROPOSED INSTITUTE.

Special attention, however, deserves a step recently taken by Dr. Werner Siemens, that well-renowned inventor and electrician of Berlin, in the interest of German art and science, towards the foundation of a "Physical-technical institution for promoting, by experiments, the exact sciences of nature and the precision-technics." Dr. W. Siemens offered to the German Empire a donation of 500,000 marks for an institution of this kind. The German Government did not hesitate to accept the liberal offer, and the German Reichstag appropriated, a few days ago, the necessary funds in the budget for 1887-'88.

This institution is to be divided into two main departments: (1) into a "scientific department," which is to devote itself exclusively to theoretic researches within the scientific domain concerned, and (2) into a so-called "technical department," intended to utilize furthermore the results of those scientific researches in a technical respect, and to render

be risked that the results of the single experimental stations could lead, instead, to a diminution, to an augmentation, or at least to an intensification of uncertainty, since a disagreement in the results of several public experimental stations is particularly annoying to the parties concerned.

ESTABLISHMENT OF A SEMINARY FOR ORIENTAL LANGUAGES.

I have referred to opinions of foreign press and representatives as to Germany's advantage in having a large stock of merchants, factors, and agents speaking the language of the country where they reside. But this country does not acquiesce in endeavors to improve her position. On the table of the German Reichstag, now in session, the Imperial Government has laid a bill to provide for the establishment of a seminary for Oriental languages, a measure taken both in favor of trade and of consular and diplomatic service. It shall be connected with the Berlin University, and its object is the teaching of living Oriental languages, with practical exercise in at present six languages, viz, Turkish, Arabic, Persian, Indian, Japanese, and Chinese. As a rule, there shall be two teachers for each of these languages, one a German, well versed in same by a long residence in the country concerned, and the other a native teacher.

The consular corps of Germany consists at present of 641 consular officers and 68 *consules missi* among 750 consular officers, viz :

AN EUROPEAN ZOLLVEREIN.

In concluding my review of the most striking features of Germany's efforts to expand her industrial and commercial power, I cannot forbear mentioning a scheme which, if carried out fully, is intended as nothing less than entirely cutting off America from the markets of Europe. This new-born child of modern political economy made its appearance under the temporary name of Central European Zollverein.

The *Kölnische Zeitung* again, which is said to be furnished periodically with semi-official articles, published a few months ago an article on the subject. I only extract, in translation, a few passages :

While formerly arguments for the advisability of protective duties were found in their educational efficacy, and while their introduction was regarded only a mere temporary measure intended to gradually render domestic industry fit for competition with foreign, now the inverse case is expressly confirmed, viz, that our industry at present is at least as efficient as that of any other nation, but that by means of protective duties we must keep out foreign goods to retain our market for ourselves. While wheat in Prussia, from and after 1878, was subject to an import duty of 1½ silver groschen per scheffel [1 scheffel = 15 imperial bushels], from 1827 to 1856 to 5 silver groschen.

climate and as derive all kinds of raw products from their own soil, and, in case their population is large and mercantile enough, to render at home possible an industrial working and utilization of these natural products.

In such a favorable situation of economy are the United States, England with her colonies, Russia, China, and, at a more remote distance, perhaps Australia.

American industry has in the last decennials taken a start which renders the supply of European articles more dispensable every day. Farming yields by far more produce than can be consumed. The large exportation from America which, therefore, must of necessity ensue at any price, will, in a controllable time, hardly diminish. A like aspect we obtain of the other countries mentioned, though the same have not yet reached a similar high degree of development.

Thus a double danger for western continental Europe draws near—on one side the abundance of the youthful, fertile soil of America and Russia, the fruits of which it will, at a not very distant day, be no longer able to pay fully in productions of its trade and artistic industry; and, on the other side, the working force of hundred millions of skillful and frugal Asiatics. * * *

Now, as manufacturers at present seek voluntarily to reduce production for the maintenance of paying prices by means of conventions, there will hardly be any better and more efficient means, as Professor von Kaufmann, a political economist at the University of Tübingen, expounds, than that also the states [of the European continent] unite and by means of treaties expand their markets, so that the surplus in any one place within their dominions may serve to make up for the deficiency in another.

Such states most qualified to enter first into such conventions are Germany and Austria-Hungary. A zollverein of that extent would embrace 82,000,000 people. Both countries produce articles which mutually supplement deficiencies. Germany would, for instance, buy its needed breadstuffs in Hungary-Austria instead of in America; India, Russia, and Austria-Hungary would buy coal in Germany instead of in England. Barriers against such articles as are produced within the zollverein would thus be duly strengthened, while barriers between the two contracting parties could, if not entirely but as much as practically, be removed. Such an economical union, once established between the two countries mentioned, would be successively joined by smaller states of Europe, which, like Switzerland, Belgium, and Holland, are particularly confined to exportation; but even France, and with it Italy and Denmark, would, in joining that union, find their account in the fight against economical commonwealths, that like the United States, Russia, China, and Great Britain, embrace whole continents, not to speak of the many advantages the "United States of Europe" could derive therefrom for a uniform legislation in social questions and for a joint proceeding in political respects. * * *

A zollverein with Austria will, therefore, be one of the tasks of the next future. * * *

GERMAN AGRICULTURE.

Having thus far tried to give a general review of changes and other noteworthy occurrences in Germany since my last annual report, I shall now give some particulars with regard to topics which consular regulations suggest as desirable subjects for an annual report. As already alluded to above, agriculture continues to remain the "child of grievance" of Germany.

"Farming stands before bankruptcy," exclaims the *Kreuz-Zeitung*, a leading organ of the Conservative party, which consists chiefly of large land-owners. It depicts the general condition of Germany in very dark colors, as it writes:

The signature of our time is the commercial collapse in the European states of culture. Farming standing before bankruptcy; industry and commerce, the destiny of ure. Scattered to the former, a primary trade, must be paralyzed. The sources of without bread, will be driven towards social * * * Distance

Since 1880 wheat and rye [per 1,000 kilograms = 22 cwt.] fell by 32 per cent.; barley, by 27 per cent.; sugar, 35; spirits, by 33 per cent.; wool by 41 per cent.* Under the pressure of supplies from Australia and South America, which from 440,000 cwts, in 1863 went up to 2,228,000 cwt. in 1884, prices for very fine wool declined by 42 per cent.; for middling and inferior wool by 50 to 52 per cent.

Raising of sheep became thus unprofitable, and was therefore reduced to 56 per cent. of the former stock. The loss the German farmers sustained thereby is roughly estimated at 157,000,000 marks.

In the same proportion as Australia, New Zealand, and the La Plata states increased their export of mutton (slaughtered sheep), chiefly to England (in steamers with refrigerator compartments), the value of exports of sheep from Germany declined. The value of such exports amounted—

	Marks.
1883	41,357,000
1884	34,956,000
1885	26,460,000

It is even worse with raising neat cattle. Holstein butter, the finest product of German dairies, experienced in the course of the last nine years a decline in price of from 142.17 marks in 1876 to 79.6 marks in June, 1886. [Severe legislative measures against margarine and other artificial butter are under contemplation.]

Dry or lean cheese, which (by physiologists) is considered the most concentrated of all articles of human food, is absolutely unsalable. Some farmers have commenced to feed cows with milk from which the cream is skimmed.

It is stated that the importation of agricultural products into Germany during the years 1872–1885 exceeded exports by 8,067,800 marks in value, a comparatively high amount, considering the fact that for Prussia alone the total value of real estate (liable to ground-tax) reaches only the sum of 18,600,000 marks.

A more rapid decline of European farming is feared when the United States, compelled by a constantly increasing competition of young agricultural countries of the globe, will evince full earnestness in the pursuit to refine and finish their raw production.

Also, this writer propounds as a remedy against the calamities stated a European Zollverein, as above described (Russia and England excepted).

INCREASED IMPORTS OF CEREALS FROM INDIA.

The appearance of a new and dangerous competitor in the international grain market is an established fact; a competitor who is able to produce even more cheaply than the United States. A Berlin trade journal (speaking of the recent fall of the price of silver, and calling special attention to the circumstance that silver had reached the lowest rate of exchange ever noticed, viz, $46\frac{3}{16}d.$), remarked:

The lower the price of silver sinks, the more disturbance of international trade by such depreciation of silver is felt. For, in the silver market, the supplanting of supplies of American cereals by Indian wheat comes into consideration.

To what extent this displacement goes on the English returns of commerce furnish a clear evidence. During the first quarter of 1886 England imported of wheat as follows:

[In 100 kilograms = 2.2 cwt.]

From—	1885.	1886.
Russia		
Egypt		
Australia		

The total exports of India rose, during the time from April 1 to July 31, 1881, from 5,895,000 cwts. to 10,622,000 cwts. in 1886.

Somewhat of a contradiction to the above complaints of German farmers gives the official publication of legally enforced public sales of real estates in Prussia, which show a decrease:

1882	16,194
1883	13,573
1884	10,528
1885	10,309

But with the striking fact that while Western Prussian provinces show a continuous decrease, the Eastern show a steady increase of public sales. In 1885 larger estates and with a better quality of soil were publicly sold; this seems to prove that the calamity of German farming becomes more intense even with estates which heretofore were better founded financially.

USURY ACT.

Much, it is true, has been done towards protecting farmers and other small people against the extortion of high rates of interest on loans and mortgages. Thus the German usury act, in force since May 24, 1880, provides that—

Whoever, by taking advantage of distress, levity, or inexperience of another person for a loan, or in case of deferring payment of a sum already due, allows or causes such advantages of property to be promised or granted either to himself or to a third person, as exceed the customary rate of interest to such an extent that, according to the merits of the case, the advantages are strikingly disproportional to the service rendered, shall be cognizable for usury, and be punished with imprisonment within six months and a fine not exceeding 3,000 marks.

Institutions are granting loans to land-owners at very low rates of interest on intangible mortgages, except in case of public sale and of such a depreciation of the realty that its net proceeds would not even reach the minimal amount of 150 marks, and except in cases where the debtor did not fulfill the obligation to insure against fire and hail. Thus, for instance, a single provincial bank, the directors of which are mostly large settled land-owners, gave, up to the close of 1885, loans on mortgages to 940 among 1,673 estates (under the statutes of the bank entitled to loans), amounting to a total of 152,551,580 marks in the single province of Brandenburg. And while heretofore a rate of 4 and $3\frac{1}{2}$ per cent. interest was paid on such mortgages, the bank has availed itself of the present low rates of exchange in the money market by causing a general conversion of all 4 and $3\frac{1}{2}$ per cent. paper into securities with lower rates of exchange.

But all these palliatives seem to be insufficient to delay the final ruin of many farmers. The decline of prices for agricultural products is constant, and this can surprise nobody, since, as Leroy Beaulieu states, the soil applied to farming on the globe has, in recent years, increased by 56 per cent. It is claimed that the augmentation of industrial activity with the increase of population in the last twenty years, due to overpro-

third, two-thirds being consumed by indispensable expenses for the maintenance of the estate, made it a demand of urgency that duties on wheat should be raised to 22 marks per 100 kilograms, and for rye to 15 to 16 marks. He argued as follows:

India offers us wheat at 10 marks for 100 kilograms (2.2 cwt). Now, adding 2½ marks for cost of transportation, and 3 marks as the present rate of duty, such wheat would be salable with a profit in our markets, when sold at a price of 15½ marks per 100 kilograms; while the domestic product sells at prices from 150 to 197 marks per ton (1,000 kilograms = 22 cwt.)

COST OF PRODUCING GRAIN IN PRUSSIA.

The Central Agricultural Union of East Prussia called recently for a report on the subject from the different districts of the province. Forty-nine reports were received in reply, stating that such cost in case of rye amounted for 1 scheffel (1.5 imperial bushels), at 80 pounds, at 4 to 6.67 marks, on an average, 5.16 marks. In case of wheat, for 1 scheffel, containing 85 pounds, 5 to 8.23 marks; on an average, 6.17 marks. This would be equal to 150 marks per 1,000 kilograms of wheat; 129 marks per 1,000 kilograms of rye; while at Königsberg, the chief trading place of East Prussia, in October, 1885, 150 marks, and November and December, 149 marks per 1,000 kilograms, and at Dantzig, the next large grain market, only 131 to 139 marks were paid for wheat; and for rye at Königsberg 118 to 123 marks, and at Dantzig 120 to 125 marks per 1,000 kilograms.

* 1 hectare = 2½ acres.

† 1 ton = 22 cwt.

‡ 1 hectoliter = 22 gallons.

As to the crop in 1886 no official returns have as yet been published. By the "International Seed Market" of Vienna this year's crops are reported to be as follows (taking 100 as a middling crop):

Countries.	1886.	1885.	Countries.	1886.	1885.
Prussia	95	94	France	85	95
Saxony	95	100	Holland	90	95
Bavaria:			England	90	95
Franconia	102	100	Northern Russia	85	80
Suevia	105	100	Central Russia	55	75
Upper Bavaria	95	105	Podolia	60	90
Palatinate	90	100	Bessarabia	80	100

PRODUCTION OF BEER.

Last year, like its predecessor, was favorable to the brewing industry. In fact it is noticeable that while many branches of industry are suffering and complaining, beer brewing holds its own in the Empire with characteristic tenacity. The prices of raw material were throughout lower than in the preceding years, and Germany's exports of beer show again an increase.

The prices for hops were, according to quality, 50 to 100 marks per 1 cwt. lower than in the preceding year, so that best Bavarian sorts sold at 150 to 200 marks only, and the best (Saatz) Bohemian hops at 200 to 240 marks per cwt. The better yield of the hops harvest in 1885 caused a further fall of hop prices. While, on a seven years' average, Germany harvested only 23,183 tons (1 ton=22 cwt.); it produced in 1885, 33,201 tons.

The crop of 1886 is estimated at a yield of 400,000 cwt. or 20,000 tons; but it is expected that the produce of the European continent will cover the quantity of hops needed. Otherwise the United States, provided a good crop would have been harvested, may have found here a good market.

In 1885 Germany imported of hops 1,384,900 kilograms, almost exclusively from Austria, viz, 1,363,000 kilograms, while it exported 12,672,700 kilograms.

BEET SUGAR.

In my report No. 206, dated November 5, 1886, I reported fully upon the critical condition of the sugar industry of this country.

By an act approved June 1, 1886, relating to sugar taxation, a new classification of sugar and a new method of collecting tax on beet sugar (equaling a reduction of export bounties) was introduced.

Section 1 provides that beet-sugar tax of raw beets for manufacturing them into sugar shall be collected at a rate of 1.70 marks (40 cents) per 100 kilograms.

Section 2 provides that for sugar either exported or warehoused in bonded warehouses or private transit store-houses, provided that such quantity warehoused is not less than 500 kilograms, a bounty shall be granted at the following rates per 100 kilograms:

Kind of sugar upon which bounty is paid.	Amount.	Equivalent in United States money.
	Marks.	
(a) For raw sugar of at least 90 per cent. polarization and for refined sugar of at least 90, but not exceeding 98 per cent. polarization:		
(1) From August 1, 1886, to September 30, 1887.....	18.00	\$4 28
(2) From October 1, 1887.....	17.25	4 16
(b) For candy and for sugar in white, full, hard loaves, lumps, tablets, cubes, &c., of at least 99½ per cent. polarization:		
(1) For the former period.....	22.20	5 28
(2) For the latter period.....	21.50	5 11
(c) All other hard sugar, not otherwise provided for, as well as for all white dry sugar (containing no more than 1 per cent. water) in crystals, also pulverized &c., of at least 98 per cent. polarization:		
(1) For the former period.....	20.80	4 95
(2) For the latter period.....	20.15	4 80

Section 3 gives owners of beet-sugar works—for the payment of the beet-sugar upon security—a credit for a term (as

		In works In other

The production of German high furnaces in blast increased again in 1885, causing a steady fall of prices. In some districts, as in the Siegerland, best puddling and Bessemer crude iron, which constituted in former years the broad bases of the Rhenish-Westphalian iron and steel production, is, to a great extent, displaced by Spanish ores, worked into superior Bessemer crude iron by the application of Thomas Gilchrist's dephosphorizing process and the Martin process.

The German works have made use of these processes with remarkable energy. A Düsseldorf report states that in the total production of Thomas steel of about 960,000 tons, Germany takes the lion's share of 600,000 tons.

A great demand from America for special kinds of iron (containing a high amount of manganese) caused—but in this branch only—the prices to rise from 62 to 68 marks per ton.

Prices for other kinds of pig-iron continued to fall during the whole of 1885.

It would be a useless repetition to state here again how production exceeded demand. This applies also to business done by rolling-mills and other branches of iron works; hence, a general movement for limitation of production by means of conventions.

Lead, after a continuous decline in price, experienced, for the first time in 1885, a slight rising. Prices went up from 19.15 to 22 marks per 100 kilograms, delivered at the works.

Prices of copper, a paper says, decline under the influence of new American copper mines, and meets a rather diminished demand in the market.

Coal prices declined in 1884 on account of the mutual competition of the coal mines themselves to such an extent that producers recognized the necessity to fix prices by conventions, which was, indeed, concluded and took effect on the 1st day of July, 1885. They succeeded at least thereby to stop a further decrease of prices, but the principal cause of unprofitableness of coal mines is found in the circumstance that branches of industry using largest amounts of coal suffer themselves of depression of business.

In Rhineland and Westphalia a coal exportation union has been formed by a number of miners to establish coal stations at remote places abroad; for instance, on St. Vincent, of the Cape Verde Islands. It is expected that the new subsidized steamship lines will necessitate a great development of coal exportation.

FOUNDRIES, BOILER, MACHINE, AND ENGINE WORKS.

This sphere of industrial activity enjoyed in recent years the great advantage of deriving its raw material or half-manufactured material at unusually low prices. Further, these branches especially have at their command a yearly growing increase of technically well-trained engineers, attributable to a superior system of special industrial (polytechnical, &c.) schools. A French paper says in this respect:

And, moreover, continually new specialists make their appearance, who, owing to a progressive subdivision of labor, furnish superior work.

Not only the usefulness of an article, but also its artistic character has of late years been cultivated in this country with special care under the supervision of the German Government. The progress in art industry can be seen in every store in passing through the larger cities of Germany. This progress must be ascribed to the action of the German design protection act, enabling the poorest inventor to secure the protection of the production of his genius.

While our country collects for every single design (1) \$10 on filing an application for a design patent for three years, (2) \$5 on issuing a design patent for seven years, and (3) \$20 on issuing a design patent for fourteen years, the Germans can have protected, upon one application, fifty designs (or models, if not exceeding 10 kilograms in weight) at the following rates: (1) 1 mark (23 cents) for one year in the first three years; (2) if a protection of a longer duration is sought, for every additional year up to ten years, 2 marks (47 cents); (3) in case of fifteen years, for every additional year after ten, 3 marks (71 cents).

In gold and silver articles business is said to have taken a new start, especially at Berlin, where skilled jewelers are much in demand. The weekly average wages for a journeyman rose from 18 marks in 1885 to 21 marks in 1886. The yearly turn-over in jewels in Berlin alone is estimated at 10,000,000 marks, and exports in these articles increase.

Especially articles rich in forms are manufactured at very reasonable prices. The brisk intercommunication with foreign countries made manufacturers familiar with the taste of other nations. The manufacture of gold articles is much influenced by a new act, taking effect in 1888, providing for stamping the fineness or standard on the articles made of precious metals, so that, when smelted, they must have the same fineness as the official stamp indicated.

PORCELAIN.

Porcelain shows likewise progress in its superior and artistic workmanship, rivaling now with the industry of Belgium. The Royal Porcelain Manufactory sets a good example. Great varieties of forms and styles, refined taste, and higher perfection of coloring and gilding are characteristic qualities of their productions. Importation of china from France has nearly ceased. Marvelous designs of porcelain tablets (for paneling the walls of cabins and saloons of the newly-equipped steamship Bavaria, belonging to the subsidized steamship line) are at present exhibited in the windows of that factory and attract the eyes of passers-by.

GLASS ARTICLES.

Business in glass articles is said to be improving. Sales in window-glass are very brisk, owing to much building activity. In articles of an inferior quality an overproduction is likewise noticeable, for which a market is sought in China and Japan. High duties have debarred, also, in this instance, the importation of foreign articles.

TEXTILE INDUSTRY.

To the few industrial branches which are reported to be in a comparatively favorable condition must be mentioned some lines of industry. Seldom has an ind-

GERMANY.

articles of that kind imported for infringement on his patent. Some of the large Berlin manufacturers of tricots tried to get over the obstacle by paying a royalty to the patentee. A report of recent date states, however, that the United States, England, and others now purchase large quantities from German tricot factories, chiefly located at Berlin, Chemnitz, and in South Germany. Notwithstanding this, prices are said to yield only a moderate profit.

A great activity shows itself also in the manufacture of carpets, though in design and beauty American carpets surpass the German article. In some cities of Germany new carpet factories are building.

But as in other lines of business, success challenges competition; competition again entails overproduction, and this makes profit impossible. This is true also in regard to carpet manufacturing. Imports of foreign carpets experience likewise a steady decline.

WOOL INDUSTRY.

A considerable improvement set in about the middle of the year 1886, when a rapid rise of wool prices surprised the commercial world. Their effect consisted in brisker returns of woolen articles, and increased exportation of woolen piece goods (woolen cloths, plushes, velveteens) as well as of woolen trimmings, and button-makers' articles followed. In woven (long) shawls, hosiery, and fancy articles, business was, on the whole, rather dull.

LINOLEUM.

The manufacture of linoleum is about to get a footing in Germany. At present there are no more than three factories, though the article has been made in England for about twenty years. Consumption of this article increases in this country.

German architects, recognizing it to be a good, durable stuff, continue to find new application for it every day. The practice is now much in vogue, in rooms of new buildings, intended for stores, offices, workshops, restaurants, &c., first simply to lay a cheap plaster floor (cement or gypsum) and thereupon to put a layer of linoleum, thus entirely dispensing with a wooden floor. Thus, it is stated, a floor is made which in its massive underground is impermeable to both vermin and moisture. Such a cover of linoleum takes the place and has the advantages of a carpet, and can be made at cheaper rates than wooden floors.

RUBBER ARTICLES.

The manufacture of rubber articles is still very active. Several works were compelled to extend working time. Demand for rubber increases daily, and there is hardly an industry which nowadays does not try to make rubber, for its many good physical properties, serviceable. Finished rubber articles have experienced a rise of 10 to 15 per cent.

PAPER.

Germany possesses by far the greatest quantity of paper in Europe, 361 in Great Britain, 351 in France, 341 in Prussia, 331 in Austria, 321 in Italy, 311 in Spain, 301 in Portugal, 291 in Belgium, 281 in the Netherlands, 271 in Denmark, 261 in Sweden, 251 in Norway, 241 in Finland, 231 in Poland, 221 in Russia, 211 in the United States, 201 in Canada, 191 in Mexico, 181 in Central America, 171 in the West Indies, 161 in South America, 151 in Africa, 141 in Asia, 131 in Australia, 121 in New Zealand, 111 in the South Seas, 101 in the Pacific, 91 in the Indian Ocean, 81 in the Atlantic, 71 in the Mediterranean, 61 in the Black Sea, 51 in the Baltic, 41 in the North Sea, 31 in the Arctic, 21 in the Antarctic, 11 in the Arctic, 1 in the Antarctic.

FISHERIES.

Nothing is worth reporting at this time, except that some efforts are made to encourage more than heretofore high-sea fishing.

GERMAN IMPORTS AND EXPORTS.

Special commerce (*i. e.*, exclusive goods in transit) are shown in Exhibits AA and BB. Exhibits CC and DD are comparative tables, showing volume and value of chief articles imported into and exported from Germany during the years 1880-'85. Exhibit EE shows the volume of German imports from and exports to foreign countries of the world in

Values of merchandise imported into the German customs territory during calendar year 1885 (exclusive of goods in direct transit and goods refined and finished) for consumption—special commerce.

[Ton = 22 cwt. + denotes increase; - denotes decrease.]

EUROPE.

GERMANY.

[illegible]

GERMANY'S TRADE WITH THE UNITED STATES.

The exports can be seen from the inclosed Exhibits B^a and B^b and C for the year ending September 30, 1886. The imports (special commerce) from the United States, but for the calendar year 1885, are reported by German statistics, the last obtainable, as follows:

Total imports	100 kilograms..	4,104,757
Exports to United States	do.....	1,695,997
Value of imports	marks..	121,766,000
Value of exports	do....	155,125,000

As chief articles imported from the United States are mentioned:

Articles.	Value.	Articles.	Value.
	<i>Marks.</i>		<i>Marks.</i>
Cotton and cotton goods	52,858,000	Drugs, dyewoods, and stuffs	2,718,000
Petroleum	29,060,000	Hair of horse, human	944,000
Oil, lard, &c	11,084,000	Animal products	556,000
Grain	9,555,000	Copper and copper articles	707,000
Groceries, spices, confectionery, &c	4,165,000	Machines, vehicles, engines	619,000
Tar, pitch, rosin	2,145,000	Leather and leather goods	397,000
Hides and skins	2,133,000	Ores, earths, precious metals	371,000
Wood, &c	3,649,000		

Remarkable appears the discrepancy (in the total amounts of exports and imports above stated) between volume and value. While considering volume, imports from the United States exceed very considerably exports to the United States; the value of goods exported to the United States exceeds the value of goods imported from there (as stated on page 85) by about 34,000,000 marks.

The items of value set forth as highest amounts for articles exported to and imported from the United States are the following:

Articles.	Value.	Articles.	Value.
<i>Exports.</i>	<i>Marks.</i>	<i>Imports.</i>	<i>Marks.</i>
Silk and manufactures of silk	40,750,000	Cotton	52,858,000
Manufactures of cotton	22,248,000	Petroleum	29,060,000
Manufactures of wool	18,938,000	Lard, &c	11,084,000
Chemicals, &c	12,715,000	Grain	9,555,000
Juices, &c	9,355,000		
Manufactures of iron	8,499,000		
Manufactures of leather	4,473,000		
Manufactures of glass	5,859,000		
Manufactures of linen	5,131,000

WORKINGMEN'S COLONIES.

In my last annual report I took occasion to call attention to so-called workingmen's colonies, established for the purpose of correcting the evil of tramping. The number of such colonies has been increased by one, in Schneckengrün, Saxony. The entire number of colonies in Germany is stated to be fifteen, and the number of persons remaining October 31, 1886, in the different stations, 1,553. It must be borne in mind, however, that during the year thousands found shelter and employment.

The colonies in Hanover, now three years in operation, admitted, within the last three years, 1,192 persons. The receipts, mostly the result of local contributions, reached 83,682.47 marks; the expenditures, 82,333.79 marks; the average expense for each person, inclusive of pay for his work, amounted to about 1.15 marks per day.

In other colonies the expenses did not exceed 55 pfennigs per day; one in Danelsberg managed to support people at 33½ pfennigs per day, after deducting pay for work. It is said that the colonies are in a prosperous condition, and receive much encouragement from charitably disposed persons. Several new colonies are under contemplation.

Rev. von Bodelschwingh, a well known clergyman of Bielefeld, is the originator of the "workingmen's colonies."

while sales and exports make a tolerable fair showing, this is chiefly attributable to low wages and the consequent possibility of underselling foreign competitors.

And here permit me to interline, that undervaluations are practiced not merely with a view of defrauding our revenue, but also to drive objectionable competitors out of the market, making it more difficult every day to consuls to ascertain correct market values; not to mention the numerous failures (bankruptcies), which frequently cause a glut in certain articles of manufacture and a corresponding depreciation of prices.

I notice a feverish anxiety to produce cheap goods, and if much of the latter, notwithstanding our high tariff, can be sold in the United States, with greater or smaller profits, it demonstrates the fact that German goods are in demand more on account of their cheapness than quality.

Germany is more than ever dependent upon foreign markets for the disposal of its manufactures. Its protective policy may secure to it the advantages of the home market, though my statements show that the anticipated rise, as, for instance, in grain and many other articles of home origin, has not been realized. On the contrary, my report shows that the general effect of the protective policy is far from having met all the anticipations of its advocates.

My foregoing report treats trade affairs from a strictly objective standpoint and presents the same under the light of present observations.

I cannot say, though it is evident, that in the great strife among the nations, especially of Europe, a permanent commercial policy must be considered as doubtful. There is a drifting tendency in all directions, and positive calculations as regards the future impossible. The factors at work on this side of the Atlantic are of so conflicting and uncertain a character that a report can only treat upon present appearances.

F. RAINE,
Consul-General.

UNITED STATES CONSULATE GENERAL,
Berlin, January 10, 1887.

MAYENCE.

Report of Commercial Agent Smith.

The reports of the various chambers of commerce in this neighborhood for the year 1885 having been recently published, I have the honor to herewith make to you my annual report for the present year based thereon and upon information drawn from other sources.

GENERAL SITUATION.

Money is cheap, prices are low, profits are slight, competition is severe, and overproduction is the cry. Such is the designation to be applied to the general state of trade in Germany at the present moment so far as I am informed respecting it.

eral years past it has been keeping up under very discouraging conditions, and now it has reached that pass when wholesale discharges of workmen have to be made. Few failures in the commercial and industrial centers appear to take place, but there is a general cry of unprofitable business. Prices during the present year have been the lowest they have been for seven or eight years, but some improvement in them seems to be just now taking place. Since 1880 there has been a gradual decline of prices in almost all the leading articles of merchandise, in wheat, rye, barley, oats, sugar, coffee, rice, cotton, wool, and so on, in some a marked decline. The average price of wheat during the year 1880, for instance, as reported by the statistical bureau at Berlin, was 230.7 marks (\$54.90) per 1,000 kilograms (2,204 pounds); during 1885 only 168.4 marks (\$40). Raw sugar brought during 1880 per 100 kilograms (220 pounds) 65.3 marks (\$15.54); in 1885 but 49 marks (\$11.66). On all articles of luxury the steady sinkage of the rate of interest and the consequent rise in value of all safe securities paying good rates of interest of course exerts a bad effect, as the capitalist's income thus becomes limited, and his expenditures more carefully made.

The opponents of the present tariff attribute all their ills to increased customs duties—to protection; but the customs duties imposed by the Government are moderate, viewed from an American standpoint, when taken all in all. High duties are ruining trade, they say, and raising up barriers of non-intercourse with other nations; they are making all the countries of the world our commercial enemies, and bringing down upon us years of industrial depression. But at the same time that this is being said, the English are exclaiming, as will appear from their press, "Look at the indefatigable Germans! See what giant strides they are making in the direction of commercial supremacy! Behold the progress they have made in the last few years! Trade languishes with us; our furnaces are being shut up and our mills closed, all largely due to the thrift and perseverance of the plodding Germans. They are looking abroad upon the world as a field and jostling us out of our markets by their energy and push; in our own island home, even, are we not safe; but behold them with stolid assurance selling their wares cheaper than our own, and filling our commercial houses with the young men of the Fatherland, who speak a polyglot tongue, to the exclusion of the young bloods of Britain, who are familiar with but the one their mothers taught them."

Business is said to be very much depressed in England, and this condition is largely due, it is claimed by many there, to German competition. The Germans, the English say, are content with smaller profits than they are, speak all languages, have clerks who work for lower wages, and are bound to no old, useless traditions. They are with their goods wherever there is a demand for them, and where there is no demand they do their best to create one. Of the entire imports into England, Germany furnishes about £25,000,000 I believe; the United States about £90,000,000.

20th ultimo I think should be incorporated in this report, and I therefore give the whole of it, word for word, as follows :

M. Amedée Marteau, who was lately charged by the French minister of commerce and industry to study the industrial evolution of Germany during the last ten years, has presented a striking report on this subject. After referring to the uneasiness and excitement created in France by the rapid development of German industry, and the severe competition of between German and French goods, not in foreign markets only but in France itself, M. Marteau says that this change in Germany became apparent in 1877. Up to that date German industry was passing through a transformation period, a period of slow and difficult preparation, during which even the most competent observers were deceived. Between 1872 and 1877 the balance of the foreign trade of the German Empire was largely adverse to it. In 1872 this balance of trade showed against Germany 972,000,000 marks; in 1874 this increased to 1,441,000,000, and in 1877 it was 1,101,000,000. Up to this last date German industry was preparing, but had not yet entered upon the scene; the Germans improved their old or created new machinery, they perfected their appliances, they placed themselves abreast with progress, and soon found themselves able to compete with the best manufactories abroad. Properly speaking, says M. Marteau, it was only in 1878 that Germany engaged seriously in the struggle. In 1877, as has been said, the German Empire imported 1,101,000,000 marks more than it exported. In 1880 the balance was reversed and was in favor of exports; but it is only fair to remark that this year was a very unfavorable one for foreign trade with Germany, for the new customs tariff, called the autonomous tariff, was applied then and large stocks of foreign goods had been accumulated in anticipation of the higher duties of this tariff. But the imports, which between 1874 and 1877 varied between 3,673,000,000 and 3,877,000,000 marks, declined steadily down to 1884, when they amounted to 3,284,900,000 marks, while the exports, which in 1874 were 2,532,800,000 marks, had increased in 1884 to 3,269,400,000 marks, an average increase for each of the ten years of about 80,000,000 marks. Thus, as German imports have steadily decreased while exports have increased, Germany is now manufacturing much which she formerly purchased abroad, and is, besides, sending abroad manufactures which she never sent before.

Whatever opinion may be entertained respecting the balance of a country's foreign trade, adds M. Marteau, it would be idle to deny that the growth of German exports, especially in the last five years, at such a rapid rate is a remarkable fact, which should fix the attention of economists and of those whose duty it is to watch the great movements of trade. This evolution manifested itself immediately in the commercial relations between Germany and France. Up to 1877 the latter sent Germany more than it received. In 1877 the balance in favor of France was 77,000,000 francs; but in 1878 Germany sold France more than it bought from her. In 1880 the balance in favor of Germany was 75,000,000 francs, and in 1884 89,000,000. Thus, in ten years a difference of 166,000,000 francs has been produced in the Franco-German trade, French exports to Germany having fallen from 486,000,000 to 328,000,000, while imports from Germany have in the same period risen from 349,000,000 to 417,000,000; in other words, France sells Germany 158,000,000 worth less than she did ten years ago and buys 68,000,000 worth more. The idea, therefore, that France is refusing to buy German products is the reverse of correct. The following short table will show the change :

Trade between France and Germany 1875-'83.

Years.	Exports from Ger- many to France.	Exports from France to Germany.	Difference in favor—	
			Of German exports.	Of French exports.
	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>
1875.....	349,000,000	426,900,000		77,900,000
1876.....	389,000,000	431,200,000		42,200,000
1877.....	372,800,000	395,100,000		22,300,000

appear from the following figures. The export of manufactured articles from Ger-
many was:

Years.	Amount.
--------	---------

In the figures chemicals, manufactures, and drugs are not included, as the German official statistics do not place these under manufactured articles. M. Marteau then examines these figures under their main heads, with a view of ascertaining where the main increase in German manufactures has been. The following short table shows this in a striking manner:

Exports of the principal manufactured articles from 1874-'84.	
	1884.
1874.	
1877.	
	942, 200, 000
	1884.

	1874.	1877.	1880.	1884.
Foreign trade of Germany, exports of the principal manufactured articles from 1874-'84.				

Articles.	1874.	1877.	1880.	1884.
Pottery, porcelain, glass, and crystal	Marks. 48,800,000	Marks. 31,600,000	Marks. 67,500,000	Marks. 79,400,000
Metal work, iron, copper, zinc, lead, tin (except precious metals)	51,600,000	78,600,000	136,000,000	276,700,000
Machines, implements, instruments, &c.	79,200,000	72,000,000	94,200,000	136,700,000
Skins, hides, and their manufactures	43,500,000	63,900,000	87,400,000	134,500,000
Tissues of all sorts, cotton, wool, silk, &c.	369,300,000	418,600,000	675,900,000	708,700,000
Paper and pasteboards.	20,400,000	28,300,000	52,800,000	65,700,000
Ironmongery, bijouterie, art objects	38,400,000	49,300,000	75,400,000	99,400,000
Total	651,200,000	742,400,000	1,189,800,000	1,501,400,000

Without entering into numerous details, which would make his report too long, M. Marteau says it is clear from his own observation, as well as from the reports of the French consuls at various German centers, that the Germans are everywhere displaying great activity, and that they hesitate at no sacrifice. In many places the industries are of recent creation, and the machinery and implements are therefore of the latest and best kind. Hence he cannot understand how some economical writers believe that Germany is now passing through an intense and dangerous commercial crisis. The truth, he thinks, is that German manufactures, encouraged by the rapid and unexpected development of exports, have produced more than they can find a ready market for. But, then, overproduction is a frequent incident in the course of trade, and cannot be said to be of a nature to produce, in this instance, a great commercial disaster.

As for the causes of this great development of German trade, M. Marteau refers to the cheapness of certain articles vital to manufacture, such as coal, iron, and wood; the cheapness of labor; the diffusion of capital by means of banks and similar institutions; the spirit of enterprise which is exhibited by so many German merchants, which leads them to establish agencies all over the globe, where they push their wares with untiring energy and perseverance; and, finally and principally, to the commercial and industrial schools of all kinds, which are increasing day by day throughout the Empire. There are now more than 250 of these establishments in Germany, where young men are initiated into the practical and technical knowledge necessary for the industrial careers which they are about to embrace. The textile and metallurgical industries especially are well taught in these technical schools. M. Marteau dwells at some length on the immense mechanical value of these institutions, and says that, owing to them, Germany possesses in an almost equal degree with England, so indispensable for every industrial nation, viz: A body of men who do not hesitate to exile themselves to remote parts of the world's

and M. Marteau believes that this must constantly increase. After giving some details respecting the prices of coal and iron, the report refers to the price of labor. Speaking generally, the writer thinks that in no part of the world do wages adjust themselves so readily and smoothly to the necessities of competition—that is to say, the workmen accept more easily than elsewhere the relations required by rigorous competition. Difficulties often arise between masters and workmen, but they are fewer and more easily and promptly settled than similar disputes elsewhere. German workmen also live on less than the French, and their wages are therefore less. This is an important item in the consideration of the rapid growth of German industry.

COMPETITION AND OVERPRODUCTION IN GERMANY.

Germany is now simply disturbed, in my opinion, by the present universal business depression and by overproduction. Her tariff may be higher than ever before, but her people buy their food and their raiment cheaper. Competition is too keen in the Empire, and the industrial establishments continue to pour out their goods, notwithstanding the great hue and cry of overproduction that is raised. They talk day and night of overproduction, and yet the man who dares propose a general shortening of the hours of labor and prohibition of work on Sundays becomes a target for the critics. There was much talk last winter about a normal day's work and of prohibiting Sunday labor, but the general feeling was too strong against it, and yet nearly every chamber of commerce and almost every business man in the country is constantly sighing over overproduction. The fierce competition reduces prices to a minimum. Cheap money enables the large establishments to go on producing and extending, while the smaller concerns are forced to the wall, and the business of the many becomes that of the few. That is now said to be the case in Germany. There is an increased production, and consequent intenser competition in all branches of business, leading to an enlargement of the big establishments and limitation and annihilation of the small ones. The purchasing power of the consumer, however, it is maintained, does not thereby become increased, as the rate of interest on money is becoming ever less. The farmer is not benefited, as he, notwithstanding the new protective duties on his products, must sell them at greatly reduced prices. Neither is the merchant, who finds his sales diminished by reason of the capitalist and farmer receiving lower incomes. Nor does the manufacturer profit by it; nor the great mass of workingmen, whose wages, in consequence of the fierce battle for existence, the industrial establishments are unable to raise. While the production increases the consumption remains the same, the market continues stocked and prices keep falling. High duties may perhaps protect the land against the surging world around it, but what is going to protect it against the intense rivalry among its own children?

EFFORTS FOR FOREIGN MARKETS.

Great efforts are being made to procure for the Empire profitable foreign markets, especially as by increased customs duties or other protective regulations the exportations to old markets have been rendered more difficult. The subsidizing of steamships, the reform of the consular service, and the protection which the Government affords to colonial undertakings are all in this direction.

the commerce of the world, now take a more advanced and assuring position, with a prospect of overreaching their competitors. "In union is strength," they are every day perceiving more and more.

As in industrial circles, so among the merchants are increased competition, low prices, and unsatisfactory profits to be noted. A change is taking place, it is said, in the manner of distribution of the producer's products into the consumer's hand. The middle-man is being pressed steadily out of the field, and the wholesale dealer is coming into closer relations with the very small dealers and with consumers. The consumers are often bound together in co-operative societies, and draw their needs from the manufacturers or importers directly, without the interposition of a medium.

WORKINGMAN'S SITUATION.

But although business is in an unsatisfactory state, it does not seem to affect the workingman greatly. Wages remain pretty much the same, and few discharges of hands take place. The stagnant state of the market only serves to make the necessaries of life cheaper, and to enhance the purchasing power of the laborer's money. This is a gratifying feature in the general depression.

GRAIN AND FRUIT CROPS.

The grain and fruit crops of the year were excellent, both in quantity and quality, but the farmer had to sell at very low figures, and found in the produce of his land but little profit. The increased duties on grain brought him little or no relief so far as prices were concerned, unless it kept out foreign exports to an extent to make salable at a fair price what would have had to yield to foreign competition or been forced down to a still lower figure. Agricultural distress prevails throughout Europe, but the German Government considers, I believe, that it is less sensibly felt in Germany than in other countries of Europe. However that may be, the German farmers have to struggle hard to hold their own. Without some sort of protection, the indications now are that they are to be overwhelmed in the future by the rich harvests of Russia, India, and the United States. Every rail laid in Russia or in India renders the transportation of grain easier and cheaper, and tends to force its value downward. The lowering of the taxes on the Suez Canal and the cheapening of ocean freights challenge America to a severe competition in the markets of Europe. What is the European farmer going to do about it? He is confronted by a monster of which his forefathers never dreamed. He has either to abandon the raising of grain altogether on a large scale and turn to other pursuits, or be protected by walls of non-intercourse, or reverse the whole system under which he has been holding and cultivating his land for centuries, and adopt methods which will enable him to battle with his dangerous foes. This last mentioned it is claimed he can do in time, but not all of a sudden, and while doing so must be protected by the Government of his country and while doing so must be protected by the Government of his country and while doing so must be protected by the Government of his country.

accounts, live too expensively. According to the general rule of real inheritance prevailing in Germany, the oldest son receives the estate of his father, but is obliged to provide for his younger brothers, and this leads usually to a heavy mortgage of the estate. Land has been run up altogether too fast in value; the rise has come to a halt, and the present low price of farm products has left the landed proprietor unable to realize a fair interest on his property and pay off his obligations to the other members of his family. He makes, maybe, $2\frac{1}{2}$ per cent. on the money the land represents, while on one-half of it he may have to pay his brothers 4 per cent. This must certainly lead to a general breaking down of the old system of estate holding and give place to something new and better.

BRANDY MONOPOLY PROJECT.

The great theme of discussion during 1886 has been the brandy monopoly project, which has met with bitter and decided opposition, and was, in short, a perfect failure. Only three members voted for it on the second reading in the Reichstag, and a new and improved bill which immediately followed the rejected one met with pretty much the same fate. To meet the constantly growing outlays of the Government new taxes become necessary, and in looking about for a source from which to derive additional revenue it occurred to Prince Bismarck that no subject of taxation exhibited so inviting a field as brandy, which is now but lightly taxed; but instead of simply raising the taxes on brandy the Government proposed to take the manufacture and sale of it into its own hands. Such a measure, of course, met with opposition in every direction. The state desires to buy up at fixed prices all the raw spirits manufactured in the realm, and after refining then retail them at home or export them to foreign countries. The state would thus become enabled to regulate production and grant or withhold licenses at will and decree prices. The Agrarians, however, instead of a state monopoly want to see a monopoly lodged in the hands of the present spirit manufacturers, and brought forward a bill to that effect at the last session of the Reichstag as a substitute for the second governmental proposition. They proposed that the present manufacturers should form a vast association of distillers and the creation of new distilleries be forbidden by law; that the Government pay them about 40 per cent. above the market price for what they turned out, to be gathered together in large tanks or magazines, all expenses connected therewith to be borne by the Government; that from this price the present tax on spirit, less 10 per cent., should be deducted, and an excise duty of 80 pfennigs (19 cents) a liter be collected on the brandy delivered for home consumption. A very nice proposal on the part of the Agrarians in their own interest!

REFORM OF SUGAR TAX.

About as prominent a question at the last session of the Reichstag was the reform of the sugar tax. The Government for a long time has been paying a bounty, as it were, upon sugar, and an urgent demand has been made for several years past.

GERMANY.

of sugar instead of $12\frac{1}{2}$, as formerly, but the Government continued to grant a drawback on the basis of $12\frac{1}{2}$. The export drawback thus became an enormous premium to the producers, and the German sugar manufacturers have been able to supply all Europe with cheap sugar, till to protect themselves different states had to increase their duties on foreign sugar. The industry has bloomed and astonishing dividends been paid. But the large profits at last led to overproduction and a crisis in the trade, and the export bounty cost the German Government about \$5,000,000. A new law has been passed this year remedying the old to some extent. Under it, from August, 1886, the tax on sugar is to be 1.75 marks ($41\frac{1}{2}$ cents) per 100 kilograms (220 pounds). The export drawback upon the same quantity of raw sugar of at least 90 per cent. polarization and upon refined sugar of 90 to 98 per cent. will be 18 marks (\$4.28) for the first year, and afterwards 17.25 marks (\$4.10). On candies and on sugar in white hard loaves, blocks, and bars, the drawback is 22.20 marks (\$5.28) for this year and 21.25 marks (\$5.05) hereafter. On all hard sugar and on all white dry sugar in crystal, crumb, or flour form of at least 90 per cent. polarization the bounty is 20.80 marks (\$4.95) to August, 1887, and 20.15 marks (\$4.79) thereafter.

SUBSIDIZED STEAMSHIP LINES.

Last year it was the steamship subsidy measure, in connection with colonial undertakings, that was the great topic of discussion. This has given place somewhat to the brandy-monopoly agitation, but is still a subject of great interest to the German nation. On June 30 last the first steamer of the new East Asia line was duly gotten off from Bremerhaven, with such ceremonies as were to be expected on such an occasion, and was received at and dispatched from Antwerp with corresponding *éclat*, making the trip from Bremerhaven to Antwerp in twenty-two hours, a gain of eight hours over the usual time; and on July 14 the first boat of the new Australian line was sent off. The ships of the first line have a speed of 11 knots an hour, so that the post from Berlin to Asia requires thirty to thirty-one days to reach Hong-Kong and thirty-four to thirty-five to get to Shanghai. Those of the Australian line have a speed of $11\frac{1}{2}$ knots an hour. The post will be carried from Berlin to Adelaide in thirty-four days, to Melbourne in thirty-seven, and to Sydney in thirty-eight. At Hong Kong a branch line is to connect, extending to Corea, and at Sydney the line is to connect with one which is to touch the Tonga and Samoan Islands. The choice of Antwerp as a stopping place is very favorably regarded by the people of the Rhineland, as the ships of the Rhine can easily connect there with. Rotterdam was, however, preferred as being the most accessible to Rhine vessels. Antwerp was chosen in preference to Rotterdam, as it was considered that the water at Rotterdam was not deep enough for the draught of the best steamers.

established, would probably be cordially supported by the German firms scattered all over the world. The capital proposed is about \$15,000,000, to be doubled in time, in shares of about \$2,500 each.

CANALS.

An increase and improvement of the waterways of the Empire is looked upon as a pressing present necessity by many, and provision has been made for the commencement of three great canals—the connection of the Baltic with the North Sea, of the Spree with the Oder, and of the Ems with the Rhine. The first mentioned is to be built chiefly from military considerations, so that the German iron-clads can get from Kiel to the Atlantic. The two others are to be constructed for commercial purposes. In connection with these there will also be canals built from the Rhine to the Elbe, and from the Oder to the Silesian Mountains. The Agrarians very strongly opposed the canals Spree-Oder and Ems-Rhine, because they feared foreign grain would be more plentifully brought into the Empire by them, but were worsted.

EXPOSITION AT BERLIN IN 1888.

Efforts have been made during the year to put through the project of a national exposition at Berlin in 1888, but the manufacturers of the Empire have shown such an indifference, and even hostility to the enterprise, that the Government refused to give it its support. The city of Berlin agreed to contribute 2,000,000 marks (\$476,900) in aid of the enterprise, on the condition that the Imperial Government would add 3,000,000 marks (\$714,000) to this sum, and that a guarantee fund of 3,000,000 marks further be raised, but the Imperial Government declined to assist the project, and it accordingly fell through. The Germans seem to think that large expositions in the different countries follow one another too fast, and cost too much money, and besides, this is no time, they say, for an exposition at Berlin, when business is in a very depressed state. The full period for expositions is over, they think. In these there are so many exhibits that the visitor cannot properly inspect and compare all that is to be seen, and the individual exhibitor is lost among his almost countless competitors. Some period of time, they think, should elapse between such expositions, until manufacturers and merchants feel the need of a new exhibition to set forth their progress and new products to the world.

HARVESTS OF 1886.

The grain and fruit crops of 1885, as said above, were excellent, as were potatoes also. This year grain will not turn out quite so well, it is reported, although the crops will be good, and fruit in this vicinity is exceedingly poor. Taking 100 as an average harvest, wheat this year, it is conjectured, will be 95 per cent. of an average crop; rye 87; barley 97; potatoes 98, and oats 101. These are only estimates, however, made in June, which are consequently very unreliable.

firmation of the urgers of the new customs duties to the contrary that the measure would raise the price of this article. The farmers thus gained nothing by the act, unless it prevented a still further decline, and enable them to sell more readily the yield of their lands. The hard sorts of wheat, however, which the millers must obtain from abroad, which used to cost about the same price as the wheat of the Bavarian Palatinate, now cost 1 mark (23 cents) to 1.50 marks (35 cents) per 100 kilograms (220 pounds) more. The barley of the Palatinate, which before the new tariff act was exported in large quantities to England and Holland, was pressed to the wall there in the past year, it is said, by barley from France and Austria-Hungary. Whether the new duties availed the farmers anything is a disputed point; those friendly to the measure claiming that they do; those opposed to them, of course that they do not help them in any way. However, there has been a great falling off, according to the bureau of statistics at Berlin, in the amount of grain imported during the first three months of 1886, as compared to the corresponding period of other years. The farmers are not satisfied with the increased duties given them last year on cereals, but clamor for still higher ones. These the Government seems not disposed to grant them very soon, if at all.

On wool, too, the farmers want a duty imposed, as sheep husbandry is represented to be in a woful state in the Empire. This they will hardly get. Although it might prove to be very beneficial to the agriculturists, it would be a blow to the whole woollen trade, which could not have an export bounty granted it corresponding to the quantity of wool used in manufacturing. A duty on wool, it is thought, would so seriously cripple the entire woollen industry that it could only be regarded as a blow at the well-being of the German nation. Germany exported in 1864 woollen yarn and goods amounting in value to about \$65,000,000, and this industry would be put in jeopardy by a duty on wool, for the native wool is said to form but one-fifth part of the whole amount employed in manufacturing.

VINTAGE.

The vintage last year was poor, and did not repay the vine-dressers for their labor and care. In many cases the costs of cultivation were hardly covered. The wine of 1885 is a racier wine than that of 1884, but sourer. Both in quantity and quality was the vintage a failure. The specific weight of the must from ordinary vineyards in Rhenish Prussia did not go beyond 75 to 80 degrees Oechsle, while the acidity reached 12 to 14 per cent. But a small quantity of this wine, it is said, can be used by the trade unmanipulated, while the great part of it must be improved in flavor by artificial methods. This year, so far as quality is concerned, the outlook is very unfavorable. In the matter of quantity the vintage will be one of the poorest for years. With regard to quality it is yet too early to make trustworthy predictions. » » » » » discovered from time to time in the vineyards of

IRON AND STEEL INDUSTRY.

The iron and steel industry has been in a critical condition. Miners of iron and workers in the same have had a very unfavorable year. The iron industry has been in a state of steady decline. Prices have been very low. Limitation of production has been necessary, and discharges of workmen unavoidable.

The Chamber of Commerce at Coblenz in its last annual report, published about six weeks ago, commenting on the state of the iron industry, says, in substance:

There has been an increased production of iron, but a further decline in prices also, which has forbidden all gain in most undertakings of the period. Especially unfavorably affected were quality raw iron and weld-iron, while the steel works were not only better employed, but obtained higher prices. An increased protection to lighten the inland market was not possible, while in other iron and steel producing countries overproduction and the strife for the market, with declining prices, were greater than in Germany, or an absolute barrier to importation was raised by high tariff duties, as was the case with Russia. Late in the autumn of 1885 an improvement occurred in the American market which had a good effect upon the European market, but only temporarily. The evil situation has continued, and even now no general improvement is reckoned upon. In very many large works, both in Germany and abroad, the effort is being made to offset the small profits realized by increased production and by using every appliance to the very best advantage, but this only makes the disproportion between production and consumption all the greater. To put an end to the continual weakening of prices, if possible, producers in different branches of the business have united in combinations, and in some instances met with success, but the opposing difficulties have been great and overcome mostly only under pressure of the greatest necessity. The effort also has been made to effect savings and obtain advantages by doing away with middlemen. While it cannot be denied that under certain conditions the middleman can be done away with in certain cases, it should not be set up as a general rule, and it should not be forgotten that it is the middleman who first, at great risk, seeks new fields of sale and establishes new trade relations, receives the full force of the strife between producer and consumer, often holds large stock, lightens the market, and thus gives to trade greater stability.

The following short table shows the prices at the beginning and at the end of 1885 of the chief materials used in the iron industry, and of the leading products thereof, the prices given being in tons at the station from which sent off:

Articles.	Beginning of 1885.	Close of 1885.
Coal	\$1 28 to \$1 33	\$1 33 to \$1 38
Furnace coke	1 71 1 80	1 80
Burnt spar	2 80	2 61
Nassovian red-iron ore	2 14	2 02
Quality puddle-iron	10 94	9 52 9 99
Foundry iron, No. 1	14 75	12 61
Spiegel iron	11 42	10 71
Luxemburg raw iron	8 09	7 14 7 37
Bar-iron	25 46	23 80
No. 1 boiler-plate	36 89	33 32
Fine sheet-metal	35 70	32 13
Wire	27 37	25 70

For iron mining the year has been more unfavorable than the preceding one. The ability to obtain Spanish and Algerian ore at low freight rates on the one side, and the increased use, through the Thomas method, of phosphoric ore from the Upper Moselle, have brought about less demand for the good but baser ore of the Lahr and the Middle Rhine and caused the mines to limit production or shut up altogether, although the owners of the mines endeavored to

short time ago an English firm underbid all the German firms for a delivery of iron rails at Altona 25 per cent. In Italy and Roumania the Germans are also said to be underbidden by the English and Belgians. The German journal *Stahl und Eisen* (Steel and Iron), in commenting on this rivalry, says that if English firms succeed in competing with German works in their own country they will be placed in a worse position than they are now in, and refers to the competitive struggle going on between the English and German works as one of life and death.

Articles made of cast iron were in active demand last year, and their manufacture was more profitable than that of most other articles in the iron trade. Prices were better, but not enough so to make business thoroughly profitable. They could only prevent further losses. Bar-iron reached the lowest price ever known, and stood at 100 marks (\$23.80), and even lower.

LEAD AND ZINC.

With lead and zinc the result was better than with iron. Lead had been very flat for a long time, and in 1885 an improvement manifested itself. There was an increased production of zinc ore in Germany in 1885, but of lead less. For both there was a good demand. Prices followed the movement of the metal market and rose somewhat in the second quarter of the year, but not enough to cause the mines which had been lying idle to resume work. Says the Chamber of Commerce at Coblenz, in substance:

The demand for soft lead was very active throughout 1885. Large stocks of finished lead were seldom on hand at the furnaces, and at times the production was hardly equal to the demand. Nevertheless, in the early part of the year prices fell and went down to as far as 20 marks [\$4.76] per 100 kilograms [220 pounds] at the works. About the middle of the year prices rose, being in July 23½ marks [\$5.59], then went down 1 to 1½ marks in the autumn of the year, but again picked up and closed at the end of the year to 24 and 24½ marks the 100 kilograms [\$5.71 to \$5.83]. The market still continues active. There was an increased production of hard lead, but apparently no increase in consumption.

There was less zinc produced. The market was gratifying, but prices went gradually down during the first six months of the year, and stood in June below 26 marks [\$6.18] per 100 kilograms at the furnaces. Then a combination was formed, after much labor, into which nearly all the furnaces of Europe entered, and the agreement adopted that after 1885 the quantity of zinc produced should be limited to that of 1884. This had an immediate effect upon the market, so that by the end of the year the price had risen to 29 marks [\$6.90] per 100 kilograms. As the combination has been formed for a long period of time and the consumption of zinc seems to gradually increase, a further rise in price is to be expected.

Raw zinc is now quoted at 28½ to 30 marks (\$6.78 to \$7.14).

COPPER.

Copper was lower in price. The increased production in foreign countries is said to forbid a hope of improvement in prices.

SILVER.

There was a material increase in the production of silver in Germany in 1885. The cause is due to increased importation of fine foreign ore, while less has been mined in Germany. Silver advanced in price a little, say 2 marks (50 cents) a kilogram, then went down gradually until the end of December, showing a fall of about 10 marks (\$2.38) per kilogram below the price at the beginning of the year, due to the fact that the legislative bodies of the United States, France, and Germany, as well as other countries, showed a disinclination to meddle with the silver question.

TEXTILES.

In textiles the situation is not gratifying. The Saxon cotton spinners on the 19th ultimo, at a gathering held at Chemnitz, on the motion of a large North German mill, agreed to limit production in consequence of the low price of cotton yarn, provided the other German mills are ready to do the same thing. The flax harvests have been inferior for the past two years, but notwithstanding its poor quality raw flax is high in price, so much so it is said that the spinners are making nothing, and are obliged to sell their products with loss. One prominent flax-spinning establishment, which in 1885 declared a dividend of 12 per cent., will declare no dividend this year, it is said, or at most a small one. For weavers in linen the situation is equally unfavorable. They are kept very busy, but complain loudly of unprofitable sales. The market has also been unfavorable for silk and half-silk goods, velvets, woolen and half-woolen goods.

LEATHER.

The business in sole-leather is said to have been pretty much what it was during the preceding year. The pressure, which is felt more or less in all branches of industry, was experienced by dealers in sole-leather, especially in the heavy kinds. This flat state of the trade in heavy sole-leather had of course an influence upon raw goods, which at the sea-ports, notably Antwerp, had to be sold at considerably reduced prices. The native hides also suffered in the same way. The increased manufacture of shoes by the factories calls for light and medium leathers to the exclusion of the heavy grades used by hand shoemakers. In upper-leathers the demand is said to have been regular and prices in general strong.

INCREASED DUTY ON LEATHER.

The men in the leather trade desire the duty on leather, which is now 18 marks (\$4.25) per 100 kilograms (220 pounds) on leather in general and 36 marks per 100 kilograms on sole-leather, made 36 marks for all leathers. Commenting on this proposition to increase the duty on leather the Chamber of Commerce at Worms says, referring to the leather manufactories in its district:

Our large leather factories do not require any protection in duty, as their products, lacquered and kid leathers, are mostly exported to lands which have a high duty and a good developed industry, as France, for instance, that levies a duty of 60 c. but would be seriously affected should an increase be made.

vach-leather croupons for use as machine belting and those for use in manufacturing shoes. With a very little fat vach-leather can be made to have the appearance of oiled leather without injuring it as sole-leather. At the same time a great injustice which is being done to the German makers of leather belting for machinery would be remedied. This industry now suffers from foreign competition just as before 1879 the sole-leather did.

CHEMICALS.

The chemical works still complain of falling prices. Customs duties in France, the United States, and Russia have materially reduced importations from Germany. Quite a number of the German chemical works have erected branch establishments on this account in foreign lands, by which the loss in exportations is made up to a certain extent.

ANILINE COLORS.

In aniline colors business is said to be dragging, with low prices. Almost all raw materials have become cheaper; especially was this the case with benzol, which at the close of 1885 stood cheaper, at a price scarcely ever reached before since the creation of the aniline industry.

PETROLEUM.

Petroleum was low in price. In the fall of 1885 the chancellor of the Empire suggested to the Bundesrath that on petroleum-barrels in future a duty of 10 marks (\$2.38) be levied as coopers' articles, as these barrels were coming into competition with those of German coopers, which was accordingly done. Respecting the imposition of this duty the Chamber of Commerce at Weisbaden thus expresses itself:

The Bundesrath, contrary to the laws of the Zollverein, has ordered the levy of a duty on petroleum-barrels as fine coopers' articles in addition to the existing gross duty, which duty is to be refunded on the re-exportation of the barrels. This is done on the ground that the cooper business suffers from the enormous importation of these barrels. But it must be urged that the American petroleum-barrels do not come into competition with the barrels of our coopers. They are so cheap in price and their durability is so great that they can be used for many purposes to which barrels cannot generally be applied, and in default of them recourse must be had to other articles for use in packing. They can hardly be done without, and our native coopers are unable to offer any substitute for them, as our barrels are far too dear and less durable.

LARD.

Lard was lower in price. Much lard is imported from America, but the larger part of it is supposed to be used in the manufacture of artificial butter.

IMPORTS AND EXPORTS.

The imports of the Empire amounted in value in 1885 to 2,944,431,000 marks (\$700,774,578), exclusive of gold and silver in bullion and coin, or 316,368,000 marks (\$75,305,000) less than in 1874, and the exports to 2,860,257,000 marks (\$680,741,166), or 344,682,000 marks less (\$82,034,000) than in 1884; but the gross weight of the articles imported amounted to 17,867,291,000 kilograms, against 17,787,720,000 in 1884, or 18,813,869,000 kilograms, against 19,151,636,000 in 1885.

The exportations during the first six months of the present year show a general increase over those made during the first six months of 1885, as will appear from the following table:

SANITARY STATISTICS.

According to the census taken December 1, 1885, the population was then 956,200 souls. During the year 1885 the number of deaths in the Duchy, according to the official report, was 21,570, exclusive of still-births, or 22.56 per 1,000 inhabitants, against an average of 21.12 in 1884, and an average of 22.26 from 1880 to 1884. Of the deceased, 5,537 were children less than one year old, and 3,900 children from one to fifteen years old. From infectious diseases of all kinds there were altogether 2,084 deaths; 624 from measles, 619 from diphtheria and croup, 270 from whooping cough, 230 from scarlet fever, 148 from typhus and nervous fevers, 97 from erysipelas, 86 from child-bed fever, and 10 from diarrhœa. From consumption, 2,789 persons died, and to acute inflammation of the breathing organs 2,342 yielded. Apoplexy claimed 626 victims, of suicides there were 237, and of deaths through accident 275. Catarrh of the stomach and diarrhea accompanied by vomiting occasioned 1,063 deaths.

METEOROLOGY.

The lowest point reached at Mayence by the thermometer during the year 1885 was on December 12, when it stood at -13.6° Réaumur, the highest on June 29, when it was at $+25.4^{\circ}$ R. The average temperature during the months of December, 1884, January and February, 1885, was $+1.99^{\circ}$ R.; during March, April and May, 1885, $+7.52^{\circ}$ R.; during June, July, and August $+14.84^{\circ}$ R.; during September, October, and November $+7.47^{\circ}$ R. The number of icy days, the greatest temperature being 0° R., were 13; the number of frosty days, with minimum temperature under 0° R., were 76; the number of summer days, with a maximum temperature of 20° R. or more, were 48; the number of rainy days were 151; the number of snowy days, 16; the number of rainy and snowy, 5; the number of foggy days, 55; and the number of days on which thunder-storms occurred were 15.

EMIGRATION.

2,503 persons, against 3,175

ITALY.

ROME.

Report of Consul-General Alden.

POPULATION.

In 1884 the population of Italy was 29,361,032, and on December 31, 1885, it was 29,699,785, showing an increase of 338,753.

There was in 1885 a very marked decrease of the death rate. In 1884 the death rate per 1,000 was 27.42, while in 1885 it was 26.51. This improvement took place both in spite of and because of the presence of cholera in Italy. As a preventive measure every village and town in Italy was required soon after the first appearance of the disease in the Kingdom to clean its streets, and in addition a vast deal of intelligent and faithful work was done by the authorities in the matter of cleaning and disinfecting buildings. The result has been the decrease of the death rate in spite of the presence of a fatal epidemic. The following statistics as to the population of Italy in 1885 will be of interest:

Population of Italy for the year ending December 31, 1885.

Total population	29, 699, 785
Marriages	233, 931
Births*	1, 125, 970
Deaths*	787, 217
Marriages per 1,000	7. 88
Births per 1,000	37. 91
Deaths per 1,000	26. 51

Recognizing the fact that the cholera, as well as certain other diseases, is largely propagated by means of contaminated water, much has been done in Italy during the past year in regard to the improvement of the water supply, and the ministry of the interior has required from each commune a full report as to the precise condition of its water supply. In short, so much has been done for the improvement of the sanitary condition of Italy, in consequence of the alarm caused by the cholera, that we may reasonably expect a further reduction of the death rate during 1886 and 1887.

AGRICULTURE.

Italian crops in 1884 and 1885.

Articles.	1884.		1885.	
	Total quantity.	Per cent.	Total quantity.	Per cent.
Wheat..... bushels..	127, 933, 066	89.	118, 265, 419	81. 87
Indian corn	94, 201, 166	106. 47	79, 906, 728	90. 32
Barley	9, 236, 656	82. 28	8, 687, 601	77. 00
Rye	1, 409, 410			
Rice				

As to the following crops, the latest attainable statistics are those of the year 1883:

Articles.	Quantity.	Articles.	Quantity.
Oats bushels..	15, 593, 497	Potatoes bushels..	16, 286, 620
Peas, beans, and lentils.....do....	5, 035, 929	Flax.....pounds..	39, 522, 802
Fave, lupins, and chick peasdo....	7, 131, 126	Hempdo....	161, 856, 646

In amount, the crops for 1885, so far as the statistics are attainable, do not materially differ from those of 1884 with the exception of the wine crop, in which there has been an increase of 152,416,378 gallons. There has been a very slight increase in the oil, the orange, lemon and citron, and the chestnut crop, but the remaining crops show a small decrease. Little has been said by the Italian authorities during the last year of the phylloxera, and it has to a large extent disappeared from Italy. During the last year the peronospora has attacked a large proportion of the Italian vineyards, but its ravages have been checked by a liberal use of lime.

Much damage was done to the crops in Northern and Central Italy in the early autumn of 1885 by floods and hail. The rains began nearly a month earlier than usual and lasted until January.

FISHERIES.

During 1885 there were employed in the various fisheries, including coral and sponge fisheries, 16,851 vessels and small boats, of an aggregate tonnage of 49,182 tons. By far the greater part of the tonnage consisted of small boats engaged in fishing in the harbors and bays of Italy. Of the whole number 15,904 vessels and boats of 41,411 tons were engaged in fishing in Italian waters, and 947 vessels of 6,634 tons were engaged in fishing in foreign waters. In 1884 there were employed in the Italian fisheries 48,359 men and boys. In 1885 the number had increased to 49,728, an increase of 1,369.

FORESTS.

The Italian Government is making efforts to prevent the further destruction of forests, and to encourage the planting of trees. There has latterly been an inclination in Italy to lose faith in the efficacy of the Eucalyptus tree as a protection against malaria, and it is denied by many persons that it has any prophylactic influence whatever. The weight of evidence seems to show, however, that in many fever-stricken regions where the Eucalyptus has been largely planted the public health has improved.

Extent of forests in Italy.

Provinces.	Extent.	Provinces.	Extent.
	<i>Acres.</i>		<i>Acres.</i>

Liguria	433,584	Sicily	252,412
Emilia	622,359	Sardinia	1,477,710
Marches and Umbria	754,738		
Tuscany (province of Lucca only)	77,144	Total	9,135,478

EDUCATION.

Although the most recent statistics show that 67.26 per cent. of the population of Italy is unable to read or write, it will not be long before this reproach is entirely taken away. Compulsory education for the young, and the rule which compels every man in the army to learn to read and write, will in the course of comparatively few years provide every Italian with an elementary education.

was 84,173, and it is probable that the yearly increase since 1883 has been at least as large.

In the various schools for secondary instruction of which I have obtained the statistics for the scholastic year 1883-'84, there were in that year 58,984 pupils, an increase since 1882-'83 of 1,441.

In the technical schools there were 33,399 pupils, being a decrease since 1882-'83 of 420. In the school of the mercantile marine there were 825 pupils, being ten less than in the previous year.

There are in Italy 21 universities, of which 4 are free; and 21 superior institutes. The number of students and of persons attending lectures in these institutes, was, in 1884, 15,710, or 840 more than in 1883.

Finally, there are the schools for special instruction. These include the military, naval, agricultural, and mining schools, and the Government conservatories of music and fine-art schools. The following statement shows the number of these schools and the number of pupils attending them:

Special instruction in Italy.

Schools.	1883.		1884.	
	Schools.	Pupils.	Schools.	Pupils.
Government schools of fine arts	14	3,140	14	3,083
Government musical conservatories (including school of recitations in Florence)	7	973	9	912
Military schools		2,503		2,865
Naval academy		167		184
Engineers' (naval) academy	49	155		149
Agricultural schools and colonies		1,151		1,151
Mining schools		93		118
Industrial and commercial schools	103	16,271	(*)	
Total		24,453		8,462

* No return obtainable for 1884.

There were thus, according to the latest statistics, about 2,500,000 children and young persons receiving instruction in public and private schools in Italy. This, of course, does not include the very large number of children of the more prosperous classes, who receive their instruction at home.

CRIME.

There has been during the year 1885 a decrease in crime which is very creditable. In 1884 there were 119,980 crimes committed or denounced to the authorities, and 24,793 convictions for crimes of all sorts. In 1885 there were 113,194 crimes committed or denounced, being a decrease of 6,786, and there were 24,101 convictions, being a decrease of 692.

To a very large extent the homicides committed or attempted in Italy are the result of the practice of carrying concealed weapons. The number of cold-blooded, premeditated murders is comparatively small, and homicides, as a rule, are committed in the heat of sudden passion. The authorities are making earnest efforts to put an end to this unpermitted to carry a pistol with-
are allowed

The following statement shows the number and character of crimes committed and denounced, and of corrections for crime in Italy in 1885:

Crime in Italy in 1885.

Total	119,980	113,194	21,353	20,679	3,539	3,422

EMIGRATION.

The increase in emigration from Italy steadily continues. In 1884 the total emigration from Italy was 147,017. In 1885 it was 157,193, being an increase of 10,176. Of this total, 59,395 emigrants went to South America and 13,096 to North America. Of the latter, 12,485 went to the United States and 611 to Canada. In 1884 the emigrants to the United States numbered 10,583 and those to Canada 265. The increase of emigrants to the United States in 1885 has therefore been 2,249 and the increase to Canada 346.

The emigration to Africa in 1885 was 6,217 as compared with 3,754 in 1884, being an increase of 2,463. This comparatively large increase has been chiefly in the direction of Algeria. On the other hand, emigration from Italy to European countries has decreased from 87,558 in 1884 to 78,232 in 1885, a decrease of 9,326.

The following statement shows in detail the direction of emigration from Italy in 1884 and 1885:

Emigration from Italy in 1884 and 1885.

Destination of emigrants.	1884.	1885.	Destination of emigrants.	1884.	1885.

RAILWAYS.

The statistics of the Italian railways for 1885 have not yet been published.

The total length of Italian railways on December 31, 1883, was 6,001 miles. On December 31, 1884, the total length was 6,292 miles, being an increase of 291 miles. The working expenses in 1883 were \$28,626,930 as compared with \$30,618,526 in 1884, being an increase of \$1,991,599. The receipts in 1884 were \$41,032,560 as compared with \$39,784,247 in 1883, being an increase of \$1,248,313. The surplus of receipts over expenses was \$11,157,317 in 1883 and \$10,414,034 in 1884.

The total cost of all the railway lines (including rolling stock) on December 31, 1884, was \$554,887,406. This gives an average cost (excluding cost of rolling stock) per mile of \$79,617.

There was in the possession of the Italian railways the following rolling stock in 1883 and in 1884:

	1884.	1883.
Rolling stock.		
Locomotives	1,913	1,807
Passenger cars	5,616	5,400
Other cars	31,740	30,450

The number of miles run by passenger cars in Italy in 1884 was 15,382,000, and by freight and construction cars 13,642,000, making a total mileage of 29,024,000. This was an increase over the mileage of 1883 of 2,489,447 miles. In 1884 the Italian railways carried 36,358,791 passengers.

Italian railways are nearly all single-track roads, but they are managed with very great care and collisions are almost unknown. The cost of the roads has been very great owing, to the conformation of the country. Railways can be carried from the west to the east coast only by tunneling the Apennines and by steep grades, while the greater part of the coast lines from Ventimiglia to Spezia and from Naples to Cape Spartivento is a succession of tunnels. The interior of Sicily and Sardinia being mountainous has also made the construction of railways in those islands very costly.

Within the last two or three years a great number of steam tramways have been built in Italy. These roads usually follow the line of an existing ordinary road, and the trains consist of three or four cars of about the size and very nearly the pattern of American street horse-railway cars. They are cheaply built and operated, and as the Government does not class them as railways, they pay no taxes on freight and passengers.

Length of railways in Italy in 1884.

Companies.	Length.	Companies.	Length.
			

Receipts and expenses of Italian railways in 1884.

Receipts.	Amount.	Expenses.	Amount.
Passengers	\$15, 750, 429	Working expenses and repairs	\$8, 558, 102
Freight	24, 619, 408	Administration	2, 658, 406
Miscellaneous	662, 723	Traffic	9, 888, 805
Total	41, 032, 560	Rolling stock	9, 513, 213
		Total	30, 618, 526

Length of steam tramways in Italy in 1884.

Provinces.	Length.	Provinces.	Length.
	<i>Miles.</i>		<i>Miles.</i>
Piedmont	403½	Rome	33
Lombardy	438	Campania	20
Venetia	66	Puglie	40½
Emilia	91½	Total	1, 150½
Tuscany	57½		

The extent of these steam tramways curiously corresponds with the enterprise and industry of the respective Italian provinces.

TELEGRAPHS.

Extent of telegraph lines and telegraphic business in Italy in 1884, the statistics for 1885 not being as yet obtainable.

Length of wires.....miles..	64, 425	Private dispatches sent in the King-	
Length of lines.....do....	18, 242	dom	5, 652, 278
Length of submarine cable.....do....	116½	Private dispatches sent to other	
Number of officers	3, 227	countries	568, 271
Employés.....	5, 958	Government dispatches sent.....	456, 303
Machines	2, 027	Dispatches received from abroad.....	664, 501
Semaphoric stations	30	Dispatches in transit	174, 937

The receipts of the Italian telegraphs during 1884 were \$2,392,016, of which \$1,939,574 was received for private telegrams.

The total expenses were \$2,020,911, showing a profit of \$371,105. The charge for telegrams in Italy is 1 lira (equivalent to 19.3 cents) for fifteen words, and 5 centesimi (equivalent to 1 cent) per word for every additional word. The machines in use are the Morse and the Hughes machines.

POSTS.

In 1884 the number of letters carried by the Italian post-office was 143,250,000. On June 30, 1885, the end of the fiscal year, the number of letters that had been carried during the year was 159,678,226, being an increase of 16,428,226. The number of postal cards carried during the same fiscal year was 35,521,098, and the number of newspapers was 173,250,108. There was a large increase in the number of newspapers as compared with the number carried in 1884, which was 102,700,000. This increase, which amounts to 70,550,108, is due to the fact that the number of newspapers carried in 1884 was 102,700,000, and in 1885 it was 173,250,108.

Receipts of the Italian post-office in 1885.

Amount of deposits withdrawn	23,079,472	94,736,390

Italian postal operations from July 1, 1884, to June 30, 1885.

Number of post-offices in the Kingdom on June 30, 1885.....	3,980
Number of Italian post-offices outside of Italy	6
Number of letters and manuscripts posted	159,678,226
Number of postal cards posted.....	35,521,098
Number of newspapers, &c., posted.....	173,250,108
Number of postal packages posted.....	4,374,284
Postal orders given out:	
Number	4,542,132
Value	\$106,136,792
Postal orders paid:	
Number	4,963,591
Value	\$113,502,658
Total receipts of post-office.....	\$7,355,522
Total expenses of post-office.....	6,408,452
Balance	947,070

In 1884 the total receipts of the Italian post-office were \$5,917,551 and the total expenses \$5,351,786, showing a profit of \$565,765. In 1885 the receipts were \$7,355,522 and the expenses \$6,408,452, showing an increase balance on the side of profit of \$947,070.

A comparison of the sums deposited in the postal savings banks since their institution in 1876, with the deposits withdrawn during the same period, shows that ordinarily the postal banks have a substantial sum of money in their charge. The excess of deposits over withdrawals in 1885 amounted to no less than \$4,430,025, and the total amount of money deposited since 1876 was greater than the amount of the deposits withdrawn by \$30,218,579.

No change has been made in the rates of postage by the Italian post-office within the past year.

There are drawn every year for service in the permanent army about 106,000 men, who serve from three to five years, according to the branch of the service in which they are enlisted. They then serve from nine to seven years in the militia, after which they pass into the territorial army. A certain proportion of the permanent army is always, in time of peace, absent from the colors on indefinite furlough, excepting a few weeks in each year when they are recalled for drill. In the territorial army are also included all able-bodied men between the ages of twenty and forty who are not exempted from military service for special reasons, or who do not belong either to the permanent army or the militia.

It should be said that the territorial army is every year improving in numbers and discipline, as it continues to receive old soldiers from the militia. The men of the territorial army go into barracks every year for two weeks, and I am glad to say that the four Roman battalions which have just performed their annual two weeks' service present the appearance of well-disciplined regular troops rather than that of what we are accustomed to regard as militiamen.

The Italian permanent army and the militia (which corresponds to the German Landwehr) are in a high state of efficiency. The officers are thoroughly educated men, and in all that pertains to military science they are as well instructed as the Prussian officers. The men are well disciplined, neat, and cheerful fellows, and as soldierly in their appearance as any soldiers in Europe. Italy has spent a great deal of money in her army, but the money has given as its return a splendid army, that can be fully trusted to defend the country against any invaders.

At present the infantry is armed with the Vetterli breech-loader, but this weapon is to be immediately converted into a magazine-rifle holding eight cartridges. The navy is already furnished with this converted weapon, which has given entire satisfaction.

THE NAVY.

There has been launched during the year 1885 only one man-of-war of much importance. This was the *Morosini*, which was built at Venice. She is a vessel of 11,000 tons displacement, and is built of steel. She is to carry armor of 45 centimeters in thickness, will be armed with four guns of 43 centimeters caliber and two of 15 centimeters, all breech-loaders, and her engines are to be of 10,000 horse-power. Two other vessels of precisely the size and character of the *Morosini* are in course of construction.

BOOKS.

There were published in Italy in 1885 6,908 books and pamphlets other than periodicals. The number published in 1884 was 6,214, and the increase was therefore 694. Of these 6,908 books, 6,671 were in the Italian language, 31 were in Italian dialects, 108 were in Latin, 72 in French, and 26 in other languages.

The greatest number of books of any one department published in 1885 was 719 theological works. Next come belles-lettres, to which department belonged 632 books. There on history and

During the year 1884, 148,281 tons of freight were entered and 305,684 were cleared in vessels trading between Italy and the United States. While the number of tons of freight cleared from the United States in 1885 was only 93 tons less than in 1884, the increase in the number of tons entered was greater by 69,884.

Grouping the results together we find the following results:

Items.	Number of vessels.	Tonnage.
Increase in 1885 over 1884 of entries and clearances at all Italian ports.....	17,029	3,716,018
Increase of entries and clearances under foreign flags.....	2,250	1,456,720
Increase of entries and clearances of vessels under the American flag.....	4	3,542
Increase of freight brought from the United States.....		69,884
Decrease of entries and clearances of vessels engaged in deep-sea fisheries.....	656	9,129
Decrease of freight cleared for the United States.....		93

On the whole there has been a substantial increase of the commerce of Italy in 1885, whereas in 1884 there was a serious decrease as compared with 1883. The failure of the tunny fishery in 1885 is to a large extent the cause of the decrease in that year of the Italian deep-sea fisheries.

MERCANTILE MARINE.

Number and tonnage of merchant vessels launched in Italy in 1885.

launched.....

in 1884 was \$964,195, from which it appears that there has been a decrease of \$399,370 in the value of the vessels launched in 1885.

There were launched in 1885, 3 steamers of an aggregate tonnage of 574, and 194 sailing vessels of an aggregate tonnage of 10,154. But one vessel of more than 400 tons was launched during the year. There were on January 1, 1885, in construction in Italian ship-yards 3 steamers and 56 sailing vessels.

Number and tonnage of sailing vessels belonging to the Italian mercantile marine in 1885.

Number of men employed in the Italian mercantile marine in 1885.

Occupation.	Number.	Occupation.	Number.
Masters.....	10,593	Naval engineers and constructors.....	259
Mates.....	638	Carpets, &c.....	13,972
Pursers and clerks.....	76	Workmen in iron-ship building.....	1,830
Engineers.....	448	Pilots.....	272
Able seamen.....	7,726	Coast fishermen.....	44,485
Ordinary seamen and boys.....	93,420	Boatmen.....	11,536
Firemen.....	1,548	Total.....	192,046
Deep-sea fishermen.....	5,243		

In 1884 the total number of men and boys was 189,162. There have been added to this force, in 1885, 2,884 persons, more than half being boys.

There were 687 desertions from the Italian mercantile marine in 1885, or 142 fewer than in 1884. Of these 687 desertions 107 took place in American waters.

It is evident from the foregoing statements that the Italian mercantile marine was in very nearly the same condition in 1885 that it was in 1884. The downward movement was, it is true, arrested, but there was no increase of tonnage worth mentioning.

SHIPPING BOUNTIES.

In December, 1885, the Italian Parliament passed a law for the encouragement of Italian ship-building and commerce, the chief provisions of which are as follows:

law, 65 cents per ton for every 1,000 miles of distance sailed, subject, however, to the following conditions: Sailing vessels, in order to receive this bounty, must not be more than fifteen years old, and steamers must not be more than ten years old. No vessels sailing in ballast can receive this bounty, and it will be paid only to vessels sailing from continent to continent. The law is to remain in force for a period of ten years.

Of course the law was passed too late to have any effect upon the mercantile marine in 1885. From the date of the passage of the law, December 6, 1885, to the 30th of June, 1886, 22 steamers and 332 sailing vessels had taken advantage of the premium offered for every 1,000 miles sailed in international navigation. Of these steamers 19, aggregating 32,700 tons, belong to the General Italian Navigation Company. This company now owns a fleet of 109 steamers of 57,633 tons, and when it is remembered that the entire Italian steam fleet consists of 225 vessels of 124,600 tons, and that there is only one other company (La Veloce, of Genoa, owning 4 steamers of 6,337 tons) of any consequence, which is engaged in international commerce, it is evident that the General Italian Navigation Company will be the chief recipient of the Government's bounty. At the time of the passage of the law this company had lines of steamers running from Italy to North America, the Atlantic coast of South America, and to India, as well as to all points on the Mediterranean. It has since then established lines to Valparaiso, and also to Singapore, Batavia, and Hong-Kong.

There were also made, up to June 30, 1886, 86 claims for the construction of wooden sailing vessels, 12 for the construction of small iron or steel steamers (all of which were tow-boats), and 1 for the construction of an iron launch. There were 15 claims for the construction of engines and boilers, 13 for the construction of boilers only, and 1 for the construction of an engine. For the repairing of vessels 150 claims were made, and 35 were made for repairs to boilers.

EXPORTS AND IMPORTS.

ITALY.

As will be seen from the foregoing statement the imports of 1885 exceeded those of 1884 by \$44,692,495, and the exports of 1885 exceeded those of 1884 by \$7,050,962. The following statement shows the categories of the Italian tariff in which these differences occurred:

Differences of imports and exports in 1885 and 1884.

ITALY.

Of the categories in which the increase of imports in 1885 was most noticeable, it may be said the increase in the category of minerals and metals, in which is included machinery, is due in a large measure to the growth of Italian industries. The same may be said of the increased importation of cotton, and of skins and hides. The increase in the importation of cereals in 1885 was very large, and the large increase in the importation of groceries is an evidence of the increased prosperity of the people.

The increase of imports from the United States in 1885 was \$2,363,092, and the decrease in the value of exports to the United States was \$2,402,078. The increase in imports from the United States was due chiefly to the increase of \$1,312,593 in raw cotton; of \$21,423 in machinery; of \$113,098 in common wood; of \$764,646 in tobacco; of \$205,931 in cotton-seed oil, and of \$387,718 in raw bovine hides.

The decrease in exports to the United States was to some extent affected by the cholera in Italy, which also seriously affected the Italian import trade. There was a decrease of \$126,698 in the value of the exports of statuary (marble and alabaster); of \$59,830 in rags; of \$1,939,351 in oranges and lemons; and of \$111,168 in grease.

IMPORTS AND EXPORTS IN THE FIRST SIX MONTHS OF 1886.

The total value of imports into Italy (excluding gold and silver coins and bullion) in the first six months of 1886 was \$132,562,827, and the total value of exports from Italy during the same period (excluding gold and silver coin and bullion) was \$111,037,197. This shows a decrease of imports as compared with the same period in 1885 of \$12,539,595, and an increase of exports of \$26,221,852.

CHOLERA.

The cholera has lingered in Italy, not only during the year 1885, but up to the present time. Its ravages in 1885 were, however, much less severe than in 1884. In the latter year there were 26,557 cases and 14,203 deaths, while in 1885 there were 6,397 cases and 3,459 deaths.

The present epidemic has been much less fatal than its predecessor. The total deaths from cholera in Italy in 1884 and 1885 were 17,758, while in 1865 there were 12,843 deaths; in 1866, 19,629; and in 1867, 127,968.

So far as remedies for cholera are concerned, it is not clear that the remedial treatment to-day is much more efficacious than it was in former days. A great advance, however, has been made in the direction of the preventive measures and in the knowledge of the way in which the disease is conveyed.

That during the present epidemic cholera has been to a very large extent spread by contaminated water has been made very clear. In the present epidemic cholera has been to a very large extent spread by contaminated water from a small river was conveyed to a little town a short distance from the river.

munes in April, 1886. There were also quite a number of cases between January 1, 1886, and June 30, 1886, in Bologna and other towns in its neighborhood.

The extent of the cholera in Italy in the winter of 1885, 1886, was greatly exaggerated by German, Swiss, and French hotel keepers, and it nowhere, except in the remote southeastern districts of Italy, assumed alarming proportions.

The following statement shows the extent of the cholera in Italy in 1885:

Statistics of cholera in Italy in 1885.

PROTECTION OF CHILDREN.

The following law for the protection of children was promulgated by royal decree on the 11th day of February, 1886, but by its terms did not go into operation until last August:

ARTICLE I.

It is prohibited to admit to labor in manufactories, quarries, and mines children of either sex under the age of nine years, or under the age of ten years, in underground works. Children over nine years of age and less than fifteen cannot be admitted to work in manufactories, quarries, or mines without medical certificates from the district council that they are healthy and adapted for the work which they desire to undertake.

ARTICLE II.

In dangerous or unhealthy labor children of either

ITALY.

ARTICLE IV.

Whoever violates the terms of this law will be punished by a fine of from 50 lire [\$9.65] to 100 lire [\$19.30] for each child admitted to work. If the offense is not the first one, the fine may be increased to double the aforesaid sum. In cases in which the offender who has taken the child to work is unknown, the fine will be inflicted upon the director or jobber who has charge of the manufactory, quarry, or mine.

ARTICLE V.

The execution of the law is assigned to the ministry of agriculture and commerces which will act in concert with the ministry of the interior. Engineers of mines and superintendents of manufactories will exercise surveillance over manufactories, quarries, and mines, and will report violations of the law. Documents relating to violations of the law shall be transmitted to the prefect of the province, who, when, ever needful, may consult the provincial sanitary council, and shall present the case to the judicial authorities.

ARTICLE VI.

The regulations to be prepared for the execution of this law, on the advice of the superior councils of health and commerce, will contain details applicable to localities.

The present law will take effect six months after its publication in the Official Gazette. We order that the present, under the seal of the State, be inserted in the official collection of laws and decrees of the Kingdom of Italy, commanding whomsoever it may concern to observe it and make it observed as a law of the state.

Given at Rome the 11th day of February, 1886.

TREATIES.

The only treaty concluded between Italy and any other country between June 30, 1885, and June 30, 1886, was a treaty with Uruguay, which was signed on the 19th day of September, 1885. The main provisions of this treaty are as follows:

There shall be complete and entire freedom of commerce and navigation between Italy and Uruguay.

The citizens of one country shall enjoy in the other the same rights, privileges, immunities, and exemptions for their commerce and navigation which are or shall be enjoyed by the citizens of the other, without paying any greater tax or impost than is paid by the latter. Ships of one country shall be treated in the ports of the other as those of the most favored nation.

Citizens of one country shall enjoy in the other the same rights to reside, travel, or carry on business which are enjoyed by the citizens of the other country, and shall enjoy exemption from military service of all kinds, and their property shall be exempt from sequestration for public use.

Each of the contracting parties agrees not to accord in its own dominions monopolies or privileges prejudicial to the commerce of the other.

The coasting trade of each country is open to the vessels of the other country on the same terms as if they were vessels belonging to the citizens of the country where such coasting trade is carried on.

In case of war between Italy and Uruguay, private property will be land or at sea or under whatever flag, except in contraband of war.

Disputes as to the interpretation or execution of this treaty are to be submitted to commissions of arbitration selected by the two Governments by common consent. This treaty is to remain in force for ten years from its date, and if one year before its expiration notice of its abrogation is not given by one of the parties to the other, it will remain in force an additional year.

REVENUE AND EXPENDITURES.

Revenue and expenditures of the Italian Government for the fiscal year ending June 30, 1886.

Ministry of public works.....	47,270,539		
Ministry of war.....	49,829,191		
Ministry of the navy.....	17,774,258		

The total receipts, ordinary and extraordinary, during the fiscal year ending June 30, 1885, were \$323,867,478. There was therefore an in-crease in the receipts during the last fiscal year of \$7,631,347. On the other hand, the total expenditures during the last fiscal year were \$20,784,538 less than during the preceding year. On June 30, 1885, the ex-penditures had exceeded the receipts by no less than \$27,132,182. On June 30, 1886, the receipts were \$1,283,703 in excess of the expenditures. The decrease in expenditures was mainly in the treasury, and was for the

NETHERLANDS.

PUBLIC DEBT.

On the 30th of June, 1886, the public debt of the Kingdom of Italy, including the floating debt, amounted to \$2,202,886,026, with an annual interest amounting to \$103,120,752. This debt was composed as follows:

Consolidated debt inscribed in the Great Book.....	\$1,737,000,000
Permanent rents in the name of the Holy See.....	12,448,500
Debts separately inscribed in the Great Book.....	102,676,000
Various debts (<i>contabilita</i> , diverse).....	307,915,430
Floating debt.....	42,846,096
Total.....	2,202,886,026

During the year the Italian 5 per cent. bonds rose above par, and continue at the date of the present writing to remain at 101 and a fraction. Those patriotic and intelligent persons who, having faith in the future of Italy, bought those bonds ten or fifteen years ago have reaped a rich and deserved harvest.

WILLIAM L. ALDEN,
Consul-General.

CONSULATE-GENERAL OF THE UNITED STATES,
Rome, November 12, 1886.

NETHERLANDS.

Report of Consul Eckstein on the trade and commerce and other material interests of Amsterdam and in the Netherlands in 1885.

TRADE DEPRESSION.

In a report on same subjects, I made last year (dated September 3, and published in Consular Reports, January, 1886, No. 60) I had occasion to make the following remarks, viz:

Within this consular district and in the Netherlands generally, the year 1884 has been replete with disappointments to nearly all interested in commerce, navigation, and industry.

While commerce and trade were subject to unfavorable conditions, it was natural that navigation and industry should be gravely affected, and suffer more or less at the same time.

Freights were very low throughout the whole year, and cargoes often scarce. Many industrial establishments found themselves short of work, and were compelled to discharge large numbers of workmen.

Neither have agricultural affairs been flourishing. Land-owners, farmers, and dairymen have good cause to be dissatisfied and to complain, the former because land depreciated in value and rents have come down, while taxes have not been lowered, and the latter on account of lower prices for many articles, the product of the farm and dairy.

Thus heavy losses were sustained from transactions in many articles of commerce; poor results were attained from navigation; most industries were in a state of extreme depression. In addition thereto there has been a considerable shrinkage in some of the year 1884, in

Holland fully in proportion to the share it enjoys in the world's commerce and in other substantial and important interests of the same.

In this place it may be mentioned that another and perhaps the chief cause for the situation of affairs, commercial and otherwise, having become and remaining so long so exceedingly unfavorable and unsatisfactory in the Netherlands is clearly traceable to the for some years last past prevailing poor and depressed condition of the colonies. The cultivation there of some of the principal products of the soil has become very unremunerative to all parties interested therein, and as a consequence thereof the purchasing power of the laboring classes, the great body of the native population, has become very largely reduced.

A combination of other untoward circumstances, inclusive of the unsettled and precarious state of Atjih, entails nowadays yearly upon the Government far larger expenditures than the revenues derived from the colonial possessions amount to. To the mother country in general they seem to bring, in these days, more disappointment and loss than they tend to its prosperity, and altogether they cause a good deal of anxious solicitude in many quarters.

Regarding the course and volume of the trade of Amsterdam in 1885, import and export, in many of the principal commodities of commerce, especially such articles as our countrymen are more particularly interested in, I have already made several reports early within the current year, and which contained all the information I could obtain respecting them.

I have done this because data, material, and statistics relating to any year's business transactions are procurable here somewhat more easily early in the succeeding year than at a later period, and because such information, if at all valuable and useful, would seem to be the more so if furnished seasonably.

Accompanying this report are four tabular statements, showing the imports and exports of most of the principal articles of commerce into and from the Netherlands during the years 1884 and 1885, &c. They have been carefully compiled from a publication emanating from the department of finance at The Hague, but owing to the very peculiar manner in which such statistics are issued in this country, they are far from conveying as lucid and comprehensive information as I should wish to give on this important subject.

SHIPPING.

From the statement of the navigation of the port of Amsterdam, herewith inclosed, it will be seen that the number of ships and vessels arrived and departed in 1885, has decreased, whereas their tonnage shows an increase as compared with the previous year, 1884.

A noteworthy feature relating to the shipping of this port consists of the continued falling off in the arrivals and departures or in the reduced employment of sailing vessels and the constantly increasing number of steamers taking their places in the carrying trade.

Even in the lumber trade, wherein formerly sailing vessels exclusively engaged, steamers were

The very

a number of vessels laden with lumber, grain, and rice, intended for places on the river Zaan, landed, instead of at Amsterdam, as they formerly did, as a rule.

Up to the time of the opening of the North Sea Canal the navigation of this port was limited to sailing vessels bringing products from the Dutch East and West Indies, mostly Government imports; further, to the arrivals of grain-carrying vessels from the Baltic, a few vessels that brought lumber, and a few bottoms from the United States with American products.

All this has become very much changed since Amsterdam has been connected with the sea by a canal of ample capacity; and being joined to the European railway system, its former isolated position has ceased to exist.

At the same time present aspects do not indicate that Amsterdam, as a port, will make any very great headway in the near future unless its harbor works and other important facilities and make them more equal and in some respects superior, if possible, to those of the neighboring ports of Hamburg, Bremen, and Antwerp.

A great deal has been accomplished in this direction during the past ten years, but to retain the results and benefits thereof, and for their increase, a great deal more still remains to be done.

Progress in this direction on any really extensive scale can, however, hardly be expected whilst the ocean traffic with the East India colonies remains as poor and unprofitable as it has been during the last two years or more.

Out-freights were generally very scarce, and the freight rates to and from the colonies unprecedentedly low.

Of sixteen steamers in the India trade and belonging to two companies established at Amsterdam, one company has temporarily withdrawn five, and still there is but little business, and that unpaying, for the ships kept running.

About the marine works at Ymuiden, the out-port of Amsterdam, the piers and breakwaters, the harbor and lock, it can be said that their good condition is well maintained and that they continue excellently to answer the purposes for which they were constructed. There is only this to be remarked, that the lock there is now found to be hardly long enough to admit and serve a certain class of vessels. This defect—a rather serious one—the Government contemplates remedying in the near future, as I am informed.

As to the capacity or depth of the canal I would observe that last year several ships drawing fully 23 feet of water passed through it and came up to Amsterdam without the least inconvenience or difficulty.

A comparative statement of the merchant fleet under the Dutch flag in the past twenty-five years exhibits a great decline of the same, as is shown by the following, viz:

Sailing	Steamers	Total tonnage.

Of these ships and vessels and during the same period of time the number which answered to the requisite conditions and were found to be fit to be permitted to transport Government products is shown by the following statement, viz :

January 1—	Sailing vessels.	Steamers.	Total tonnage.
	No.	No.	
1860	536		280,000
1870	350		215,000
1875	193	10	178,000
1880	117	13	130,109
1885	82	31	135,000

Number of ships and vessels arrived at and departed from Amsterdam, from and for United States ports, specifying their cargoes, during the years 1884 and 1885.

Passenger traffic between Amsterdam and Java by the steamers of the Steam Navigation Company Netherland, which made thirty-five round trips in 1885.

Classification.	From Amsterdam to Java.		From Java to Amsterdam.	
	Total.	Average per voyage.	Total.	Average per voyage.
First-class passengers:				
Adults	874	25	758	22
Children under ten years	203	6	278	8
Second-class passengers:				
Adults	280	8	396	11
Children under ten years	18	1	82	2
Servants of passengers	85	2	83	2
Total first and second class passengers				
Total third class				

There has not been any very material change in the passenger traffic to or from Java for several years last past, in so far as through passengers are concerned.

It may also be interesting, if not useful, to be stated that the average time consumed in the outward voyage was, in 1885, forty-three days and eight hours, and the shortest time in which any outward voyage was made was thirty-eight days and twenty-two hours. The average time required to make the home voyage was forty-three days and twenty-two hours, and the quickest home voyage was made in thirty-eight days and thirteen hours.

Passage rates from Amsterdam, Marseilles, and Port Said to Batavia and Padang, and vice versa, in 1886.

Adults or children above ten years of age.....	800	700	600
Children above two and under ten years of age.....	400	350	300
Two children under two years of age, together occupying one berth....	400	350	300

One child under two years of age taken free, but no berth will be allotted. Any passenger or passengers desiring the exclusive use of a cabin will be charged, if he or they can be accommodated, at the rate of 250 florins for each unoccupied berth in such cabin, in addition to the regular fare as above. Married couples, with or without children, cannot be allowed to occupy part of a cabin excepting under the conditions last above named.

No modifications of the foregoing rates can be entertained, except in the case of families of seven or more persons, principally adults.

The port of embarkation must be distinctly stated at the time the passage is engaged.

A reduction of 10 per cent. on outward and homeward passage moneys will be made to passengers returning to Java, who have arrived from Java by one of the company's steamers, provided their embarkation takes place within twelve months from the date of their arrival, and the reduction is claimed when the return passage is engaged, and that they have had no reduction whatever on the outward voyage.

Homeward freights.—The range of freights per steamer from Batavia, Samarang, and Soerabaya to Holland was as follows in 1885:

Articles.	Rate.
	<i>Florins.</i>
Coffee, per 900 kilograms.....	32½ to 35
Sugar, per 1,000 kilograms.....	20 22½
Tin, per 1,000 kilograms.....	15
Indigo, per 650 kilograms.....	45 60
Spices, per 650 to 750 kilograms.....	40 65
Tobacco, per 400 kilograms.....	25 30
Rice, per 1,000 kilograms.....	20 25

These rates may serve as some sort of basis for merchants, they being, of course, subject to modification.

OTHER FREIGHT RATES.

The Royal Netherlands Steam Navigation Company kindly handed me a statement giving the rates of freight at which they carried small and large quantities but not full cargoes of grain, &c., from Baltic ports to this port and Rotterdam in 1885, which is as follows, viz:

From Dantzic.—Wheat, per 2,400 kilograms, 10 to 13 florins; sugar, per ton, 8s. 6d. to 10s.; deals, per load or 50 cubic feet, 8s. to 9s.

From Königsberg.—Wheat, per 2,400 kilograms, 7 to 14 florins; hemp, per ton, 12s. 6d. to 17s. 6d.; seeds, per 2,400 kilograms, 7½ to 10 florins.

From Libau.—Oats, per 320 English pounds, 1s. 3d. to 1s. 6d.

From Revel.—Wheat, per quarter, 1s. 3d. to 2s. 3d.

From St. Petersburg.—Wheat, per 1,000 kilograms, 3¼ to 4½ florins; groats, per 1,000 kilograms, 3.67½ to 4.20 florins.

SHIP-BUILDING.

The position of the Netherlands as a maritime nation and the country's situation and facilities for ship-building may, to a goodly extent, be inferred from the figures given in the following tabular statements compiled from a publication prepared and issued by the Society for Statistics of the Netherlands:

State of the commercial marine of the Netherlands, giving the number of iron, composite, and wooden sailing and steam vessels in the foreign trade each year from 1877 to 1884, inclusive, and their registered measurement.

Years.	Sailing vessels.		Steamers.		Total sea-going vessels.

It is observed that the ship-building of this
that but few sea-going

From the foregoing it will be observed that the ship-building of this country is not in a very flourishing condition; that but few sea-going vessels for the foreign trade are being constructed in its ship-yards, and none at all of really large dimensions.

As Holland does not produce either iron or coal, and hardly any timber, it cannot be said to possess facilities of the highest order for ship-building purposes, whilst in many other respects the country seems extremely favorably situated and in every way amply prepared to build ships of any class, size, and material for the ocean traffic as well as for herring and other fish-

considerable, and I regret that there are no statistics to be had relating thereto.

The above tabular statements do not cover the year 1885, but I am informed that as regards ship-building at Amsterdam, and in all Holland, there has been but little difference in the amount of tonnage finished during that year as compared to 1884, and certainly no improvement in the industry in question.

IMPORTS OF AMERICAN MANUFACTURES.

Knowing that interesting and useful information and suggestions intended and calculated to foster and promote the export trade in the products of our industries are always welcome and appreciated, I never fail to improve to the fullest extent such facilities as are at hand in gaining information bearing thereon and connected therewith, and report the same. But having frequently and at short intervals written upon the subject during the past few years, I find that but little of importance has occurred since the date of my last report upon the matter that could be stated now.

The observations relating thereto and contained in my report of the 3d of September, 1885, and as covering the year 1884, apply about equally as well to the year last past, 1885, and whilst I should not like to repeat them, I have no hesitation to refer to them.

The imports of and trade in articles the manufacture of the United States were last year, and are up to now apparently, or so far as I can judge, very much the same as they were during the preceding years of 1883 and 1884.

The demand keeps up and the business is being maintained in a very large number of different articles, but in only comparatively few of them is it of much importance.

Whilst from one or another cause the trade in certain articles stopped or declined, it increased in others, and new articles have been introduced, and found a market.

Mr. Fred. K. Stieltzes, the intelligent and energetic representative here of a number of American manufacturers, states to me that he considers that at this time there are good opportunities for the successful introduction of American machinery for use in different industrial establishments, and also for engineering implements and supplies.

Any person or firm interested in this information and desirous to obtain correct and reliable data may apply for them to the above-named gentleman. Besides I am myself ever ready to procure and furnish information to any and all manufacturers and exporters, &c., who may wish to be posted as to the chances or prospects for finding in this country a market for their products or wares.

To give in a report like this particular, accurate, and really useful information concerning many classes of goods is hardly practicable, whereas it is comparatively much less difficult to obtain and give information of such a character as respects one or but a few articles at a time.

It has just been brought to my knowledge that Worthington steam-pumps, first brought here only a few months ago, are now being worked at various water-works and in several

The American Manufacturing Company, Waynesborough, Pa., has recently furnished an evaporator for one of the largest fruit-preserving establishments here.

The Troy Laundry Machinery Company has also an agency here, and their washing-machines compete successfully against those of English and French manufacture.

The Gardner compensation governors, for regulating the speed of steam-engines, are highly favored by the leading engineers of this country, and getting to be largely in use.

Tarr & Wonson's copper paint, for the bottoms of vessels, and Prince's metallic paint for painting iron-work, are finding ready sale.

The imports of lubricating oil are increasing, but chiefly for re-export to Germany.

Remington type-writers are growing in favor and their sale extending. The trade in school furniture and school slates is also well maintained.

The agent of the Singer sewing-machines writes to me that the general imports and sales of sewing machines fell off considerably during the year 1885 as compared to 1884 and previous years, but that his own business experienced no diminution whatever, and therefore he considers himself justified in concluding that the competition, especially from Germany, has lost ground and is weakening.

EXPORTS TO THE UNITED STATES.

The herewith-transmitted tabular statements of the classified exports from this consular district to the United States during the year ended June 30, 1886, show that they were unusually large, exceeding those of any twelve-month on record, being in excess of \$2,464,654.31 over the exports in the fiscal year ended June 30, 1885.

This great increase is principally accounted for by the very much larger shipments of Sumatra tobacco which took place during the year 1885-'86, and more particularly during the September and December quarters of 1885, as compared with those of same period in 1884.

I have already reported and would here again state that the exports of this article to the United States will be very much less during the current calendar or fiscal year.

Present indications, however, are that the shipments will be quite extensive again, and that the high prices and certain defects in quality do not deter American purchasers in sending large supplies to our markets.

It would also seem to deserve to be remarked that the increase in the exports is to a considerable extent also owing to the more important shipments of coffee and diamonds, the declared invoice value of the coffee exports in 1884-'85 having been only \$408,732.50, whereas in 1885-'86 it was \$867,085.18, an increase of over 100 per cent.; and the invoices for diamonds certified to at this consulate and shipped from here to the United States amounted during the year ended June 30, 1885, to but \$211,634.84, whilst during the year ended June 30, 1886, to \$974,355.37.

largely diminished.
